# FOREWORD

In Minerals Yearbook, 1939, the Bureau of Mines presents an economic review and statistical summary of the mineral industry of the United States in 1938. This annual service was inaugurated in 1866 and since 1925 has been the principal function of the Economics and Statistics Branch of the Bureau of Mines. In the performance of its duty this branch of the Bureau endeavors to supply producers and consumers of mineral products, as well as the general public, with as much factual data as is possible with the limited funds appropriated for this purpose. Every effort is made to maintain the high standard of accuracy that has prevailed in the past, and at the same time to publish the finished volume at the earliest possible date. In view of the tremendous importance of mining to the industrial life of the United States, the constantly increasing difficulty of finding new deposits and maintaining production from old ones, and the growing realization of the significance of minerals in international affairs, the necessity for official fact-finding of the type presented in this series of publications cannot be overemphasized.

Unfortunately, the year 1938 was a poor one for the mineral industry. The industrial recession that began the latter part of 1937 continued at an accelerated rate in the first half of 1938. With production schedules geared to 1937 requirements, stocks mounted rapidly as sales fell abruptly; prices declined accordingly. In some commodities midyear inventories exceeded or approached the depression highs established in 1932 and 1933. Prices, however, did not reach the distress levels of 1932. During the last half of 1938 there was substantial improvement. Sales increased appreciably, and curtailment programs begun earlier in the year were effective in cutting down production. Stocks again declined and prices regained most of the losses incurred during the first 6 months. At the close of the year the outlook was considerably brighter than at the beginning.

The national defense aspects of minerals received considerable attention during 1938, and legislation authorizing the purchase of war-reserve stock piles of the relatively few minerals that the United States obtains abroad was introduced in Congress. In keeping with its policy of presenting timely and useful information, the Economics and Statistics Branch has summarized the domestic situation on the more important deficient strategic minerals in this issue of the Yearbook.

The Bureau's activity in collecting marketing statistics was extended in 1938. The annual survey of consumption of pig iron and iron and steel scrap, begun in 1935 on a temporary basis, was established permanently as a result of an appropriation granted by Con-

1068160

Digitized by Google

gress in response to requests from industry for continuation of this work. The results of the survey for 1938 are included in a separate chapter entitled "Scrap Iron and Steel" in Minerals Yearbook, 1939. This volume likewise includes for the first time statistics on the sales of barite by consuming industries and a survey of kerosene consumption.

The practice, adopted last year, of issuing the separate chapters of the Yearbook as preprints as soon as they are completed, was well-received by the public and is being continued this year.

JUNE 23, 1939. JOHN W. FINCH, *Director.*

# INTRODUCTION

Despite sharp declines in production of virtually all important minerals the record of the mineral industry in 1938 was better than that of business in general. The index of the Federal Reserve Board for minerals was 98, a drop of 15 percent from 1937, whereas the combined index for all industry was 86, a drop of 22 percent.

The preliminary total value of mineral production in the United States in 1938, as reported to the Bureau of Mines by producers, was $4,354,000,000, a decrease of 20 percent from $5,413,600,000 in 1937. Metals, as a group, showed the sharpest decline—40 percent—followed by mineral fuels, with a drop of over 12 percent and nonmetals with nearly 12 percent.

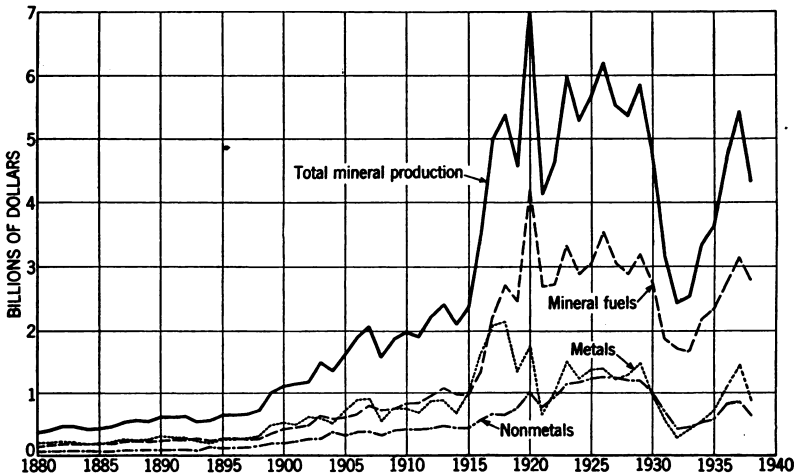

FIGURE 1.—Mineral production of the United States, 1880-1938.

Gold was outstanding among the principal minerals, in that production in 1938 increased appreciably from 1937. Aluminum output was only 2 percent below 1937, but copper, lead, and zinc dropped from a third to a fifth below 1937 levels and, largely as a result of smaller production of base metals, silver output also declined. The depressed condition of the steel industry was responsible for a drop of 61 percent in iron ore production, and most of the other minerals used in steel manufacture—fluorspar, fluxing stone, coke, and alloying metals—showed similar declines. Molybdenum was the notable exception, for production again increased in 1938 although shipments were lower than in 1937.

The relatively mild winter of 1938 as well as low industrial activity resulted in a drop of 23 percent in bituminous coal and lesser declines in output of anthracite, petroleum, and natural gas. Natural gasoline production increased slightly. The output of the building

Digitized by Google

materials group—cement, stone, sand and gravel, gypsum, lime, and clay products—in general was roughly 10 percent lower in 1938 than in 1937, although total slate production was slightly higher owing to increased demand for granules. The conspicuous exception to the general downward trend of the other nonmetals was bromine, production of which again rose to a new record.

*Strategic minerals.*—The mounting interest in strategic and critical materials culminated early in June 1939 with the passage of an act—

To provide for the common defense by acquiring stocks of strategic and critical materials essential to the needs of industry for the manufacture of supplies for the armed forces and the civilian population in time of a national emergency, and to encourage, as far as possible, the further development of strategic and critical materials within the United States for common defense.

This act carries authorization for the appropriation of $100,000,000 during 4 fiscal years beginning July 1, 1939, for procuring stock piles of strategic commodities. Obviously, this sum is not adequate to establish emergency supplies of all deficient minerals or other materials, but the legislation marks the first major peacetime effort to meet the strategic-material problem. The bill also authorizes the appropriation of $500,000 annually for 4 years to the Department of the Interior for an investigation of domestic resources of deficient strategic minerals with a view to developing production therefrom. Of the sum authorized, $350,000 is to be expended by the Bureau of Mines and $150,000 by the Geological Survey.

The Army and Navy Munitions Board late in 1938 defined strategic materials as "those essential to the national defense for the supply of which in war dependence must be placed in whole, or in part, on sources outside the continental limits of the United States, and for which strict conservation and distribution control measures will be necessary." Ten of the 17 commodities included on the list of strategic materials are of mineral origin, as follows: Aluminum, antimony, chromium, manganese (ferrograde ore), mica, nickel, quartz crystal, quicksilver, tin, and tungsten.

The Board defined critical materials as "those essential to the national defense, the procurement problems of which in war, while difficult, are less serious than those of strategic materials because they can be either domestically produced or obtained in more adequate quantities or have a lesser degree of essentiality, and for which some degree of conservation and distribution control will be necessary." Nine of the 20 commodities classified as critical materials are of mineral origin, as follows: Asbestos, cadmium, cryolite, fluorspar, graphite, iodine, platinum, titanium, and vanadium.

The Bureau of Mines has occupied an important position in the investigation of the deficient-minerals problem. A member of the staff has served prominently on each of the 17 commodity committees, appointed by the Assistant Secretary of War. John W. Finch, Director of the Bureau, and J. W. Furness, Chief, Economics and Statistics Branch, prepared an analysis of the strategic-mineral problem. They summarized their findings as follows:

Despite the costly experiences of the World War the industrial preparedness program of the United States still contains a major weakness by reason of its failure to provide adequate supplies of our deficient minerals for use in time of stress. While the situation in some commodities has improved since 1918, it has become more acute in others. The United States is no longer dependent on foreign sources for nitrates, potash, and platinum, for example, and domestic production of a few other commodities has been expanded. On the other hand, exhaustion

Digitized by Google

of higher grade ore bodies, as in the case of mercury, and the tremendous increase in the use of such essential metals as tin, manganese, chromium, tungsten, and aluminum has increased our dependence on foreign sources of supply for these commodities. Deficient minerals, therefore, still constitute a major problem in national defense.

Two methods of solving this problem have been suggested: The purchase of stock piles of strategic minerals to be held in reserve for military and civilian uses in an emergency, and the stimulation of domestic industries by tariff protection or other subsidies.

Congress adopted the second method in 1922 when it established an import duty on manganese ore, but during 14 years of protection ranging from 50 to 100 percent ad valorem, only 5 percent of our metallurgical requirements were supplied from domestic sources. As a result of this experience with tariff stimulation and the present need for strengthening national defense, the value of the stock-pile method is receiving wider recognition. The purchase of a manganese stock pile was advocated in the annual report of the Secretary of War for 1927 and the Naval appropriation bills for the past 2 years have included small sums for the purchase of reserve supplies of strategic minerals.

The Bureau of Mines believes that the purchase of stock piles of standard-grade materials is the first step in providing a safe solution of the deficient-mineral problem and recommends immediate action in this direction. It is realized, however, that it would be impractical to obtain stock piles large enough to safeguard the nation in a prolonged war and for this reason domestic resources must be considered as a supplementary source of supply in emergency. The Bureau recommends, therefore, that a national inventory of domestic deposits be undertaken at once by appropriate government agencies and that a carefully prepared plan be developed for exploiting these deposits in time of need. If adopted, this two-point program will guarantee adequate supplies of essential raw materials and thus assure the completion of the industrial mobilization plans to be inaugurated in the event of war.

It is indeed gratifying that the recommendations of the Bureau have been adopted virtually unchanged in the legislation providing for stock piles. Many of the historical data assembled during this study are included in the chapters of this volume, thereby establishing their permanence for future reference.

*Minerals Yearbook series.*—Minerals Yearbook, 1939, continues the progress made in Minerals Yearbook, 1938, in presenting final data for the year under review by including complete final statistics for metal mining in Arizona. A new chapter on scrap iron and steel has been added. Only the chapters on bituminous coal, coke, petroleum, natural gas, and natural gasoline are based on preliminary data for 1938.

The practice of issuing preprints of separate chapters in advance of the bound volume was introduced last year. It met with widespread favor and is being continued this year; 48 chapters have been printed and distributed. This procedure was adopted with some misgiving because of its potential lowering effect on sales of the bound volume. This apprehension proved to be unfounded for total circulation of Minerals Yearbook, 1938, was more than 9,000 copies, and the sales edition was exhausted several months before the appearance of the present volume.

*Acknowledgments.*—By act of Congress the collection of production statistics of the bituminous-coal industry previously conducted by the Bureau of Mines was transferred to the National Bituminous Coal Commission July 1, 1937. Although the Coal Commission did not conduct a canvass of production for 1937 comparable to earlier years, the statistical record of the industry, maintained by the Geological Survey and the Bureau of Mines since 1880, remains unbroken for the Commission has prepared a chapter for this volume based on data from various sources. Preliminary data for 1938 also are given. The

Digitized by Google

cooperation of the Coal Commission in contributing this chapter is gratefully acknowledged.

Presentation of data on imports and exports in Minerals Yearbook is made possible through the cooperation of the Bureau of Foreign and Domestic Commerce.

The statistical program of the Bureau of Mines depends entirely on the good will and voluntary cooperation of those interested in mining. It is a pleasure to acknowledge the general support of thousands of individual mine operators, distributors, and consumers, as well as the many public officials and agencies that have returned questionnaires or otherwise supplied information. In addition, the Bureau is indebted to a large number of trade associations for liberal contributions and advice.

In the collection of mineral statistics in several States the Bureau of Mines receives the formal cooperation of the State geologist or comparable State official. This arrangement eliminates duplication of canvasses by the State and Federal Governments and, through field contacts of the State officials, tends to improve the accuracy and coverage of the production data. State agents cooperating in the 1938 canvass were: Walter B. Jones, State geologist, University, Ala.; Herman Gunter, State geologist, Tallahassee, Fla.; Garland Peyton, director, and Richard W. Smith, geologist, division of mines, mining, and geology, Department of Natural Resources, Atlanta, Ga.; M. M. Leighton, chief, and Walter H. Voskuil, mineral economist, State Geological Survey Division, Urbana, Ill.; A. C. Trowbridge, director, Iowa Geological Survey, Iowa City, Iowa; Raymond C. Moore, State geologist, Lawrence, Kans.; Edward B. Mathews, State geologist, Baltimore, Md.; R. A. Smith, State geologist, Lansing, Mich.; H. A. Buehler, State geologist, Rolla, Mo.; Meredith E. Johnson, State geologist, Trenton, N. J.; Charles C. Adams, director, D. H. Newland, State geologist, and C. A. Hartnagel, assistant State geologist, New York State Museum, Albany, N. Y.; H. J. Bryson, State geologist, Raleigh, N. C.; Robert H. Dott, director, Oklahoma Geological Survey, Norman, Okla.; E. P. Rothrock, State geologist, Vermillion, S. Dak.; E. H. Sellards, director, bureau of economic geology, Austin, Tex.; Arthur Bevan, State geologist, and Linwood H. Warwick, chief clerk, Geological Survey, Charlottesville, Va.; Harold E. Culver, supervisor, division of geology, department of conservation and development, Pullman, Wash.; and E. F. Bean, State geologist, Madison, Wis. In addition, Walter W. Bradley, State mineralogist, San Francisco, Calif., assisted in the compilation of statistics for California.

In addition to preparing the statistical summary of mineral production each year Martha B. Clark has been largely responsible for the maintenance of continuity of data and uniformity of statistical presentation throughout the Minerals Yearbook volumes.

Elva T. Shuey served as editorial associate in reviewing and checking chapters, and Max Abel assisted in the administrative details of the Yearbook program. The illustrations for the volume were prepared in the graphic section of the Bureau under the direction of Louis F. Perry. Mabel E. Winslow supplied helpful suggestions for improving individual contributions and, in collaboration with Eleanor C. Reid, was responsible for the editing of the entire manuscript.

H. HERBERT HUGHES.

| Changes in form of presentation | 1 | State tables | 14 |
| Unit of measurement | 2 | | |
| Elimination of duplication | 2 | | |

### INTRODUCTION

This report continues the series of annual statistical summaries published in previous years as chapters of Mineral Resources and Minerals Yearbook.

#### CHANGES IN FORM OF PRESENTATION

A change, which it is believed is most desirable, has been made in the first two tables of this summary in the form of presentation. In the first table all minerals produced are listed separately under metallic or nonmetallic, and the entry "Unspecified", given in earlier chapters of this series, has been eliminated. In the second table this change has been carried back through 1880, the first year of record. For years beginning with 1914 the breakdown of "Unspecified" into metallic and nonmetallic has been based on actual figures; prior to 1914 the distribution has been made arbitrarily—divided equally—as no figures are available for closer separation.

Attention is called also to a change in presentation of figures for the clay industry for 1936, 1937, and 1938. As no figures are available for the total clay produced, earlier chapters of this series included in both United States and State totals the total value of clay products and excluded the value of the clay sold as such by producers. The Bureau of Mines, however, believes that a closer approach to the value of domestic clay in its first marketable form will result from the inclusion of the value of clay sold by producers and of clay products other than pottery and refractories. The change has been made in this chapter in the United States totals for 1936 to 1938 and in the State totals for 1936 and 1937. It should be borne in mind when comparing these values with those for earlier years.

Digitized by Google

## UNIT OF MEASUREMENT

The unit of measurement used by the Bureau of Mines for each mineral product in reports on the mineral resources is that common to the industry concerned, and the variation in these units makes it impracticable, if not impossible, directly to combine and compare the different minerals except as to value. Although most of the products are measured by weight, some are measured by volume, some by number of "pieces," etc., and for some no total quantity figures are available.

## ELIMINATION OF DUPLICATION

In the totals for the United States, shown in the following "general" tables, duplication has been eliminated wherever practicable, and in the State totals given in the State tables virtually all duplication has been eliminated. For instance, in both general and State tables the output of coke is shown but its value is not included in the totals, as the value of the coal used in its manufacture enters into the value of the coal production which is included in the totals. For asphalt, both native and oil are shown in the general tables, but the value of the oil asphalt is excluded from the totals as it duplicates that of the petroleum from which it is manufactured.

*United States totals.*—In the general tables both iron ore and pig iron are shown, but the value of the pig iron rather than the iron ore is included in the United States totals, as that is considered the better means of presenting the statistics for iron in its first marketable form. For gold, silver, copper, lead, and zinc the value of "smelter output" is included in the general totals, and to account more fully for the value of the ores treated these smelter figures are supplemented by the value of the byproduct sulfuric acid. The value of pigments (white lead, red lead, lithopone, litharge, and orange mineral) manufactured from metals is not included in the general tables, as the base from which they are made is included in the output of lead or zinc, whereas the value of sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide is included, as these are made in large part direct from the ores and do not enter into the lead or zinc totals, which represent smelter output.

*State totals.*—In the State tables also iron ore and pig iron are both shown. As blast-furnace products cannot be traced to the States in which the ore is mined, the value of the ore is used in the State totals. For ores of gold, silver, copper, lead, and zinc no values are shown, and in fact none are recorded; instead, for each of these metals the recoverable content of the ores is used as the basis of valuation. The value of the zinc and lead pigments is not included in the State total, as the recoverable zinc and lead content of the ores from which the products were made is included under zinc or lead. The value of the sulfuric acid produced as a byproduct of copper and zinc smelting and zinc roasting is not included in the State total, as tracing this product back to the State producing the ore has not been possible.

*Mineral products of the United States, 1936–38*—Continued

| Product | 1936 | | 1937 | | 1938 | |
|---|---|---|---|---|---|---|
| | Quantity | Value | Quantity | Value | Quantity | Value |
| SUMMARY | | | | | | |
| Total value: | | | | | | |
| Metallic | | $1,081,600,000 | | $1,468,200,000 | | $891,800,000 |
| Nonmetallic: | | | | | | |
| Fuels | | 2,759,200,000 | | 3,200,500,000 | | 2,804,700,000 |
| Other | | 716,000,000 | | 744,900,000 | | 657,500,000 |
| Grand total approximate value of mineral products | | 4,556,800,000 | | 5,413,600,000 | | 4,354,000,000 |

[1] In this general statement certain of the figures represent shipments rather than quantity mined, and some of the figures for 1938 are subject to revision. For details see following chapters of this volume.

[2] Figures represent antimonial lead produced at primary refineries from both domestic and foreign primary and secondary sources; no figures for value of antimonial lead available. Estimate of value of primary antimony and lead contents of antimonial lead from domestic sources included in total value of metallic products.

[3] Largely from foreign ore; Bureau of Mines not at liberty to publish figures.

[4] Value not included in total value.

[5] Value included in total value of metallic products; Bureau of Mines not at liberty to publish figures.

[6] Product from domestic ores only.

[7] According to Bureau of the Mint. Valued at $35 per ounce.

[8] Figures not available.

[9] Figures showing values not available.

[10] Figures for 1938 not yet available.

[11] According to Bureau of the Mint.

[12] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1936: Bismuth, iron ore sold for magnets (5 long tons), and iron ore sold for paint (10,348 long tons, valued at $53,037).

1937: Bismuth, iron ore sold for magnets (2 long tons), and iron ore sold for paint (8,375 long tons, $48,005).

1938: Bismuth, iron ore sold for magnets (2 long tons), and iron ore sold for paint (9,694 long tons, $44,249).

[13] Figures obtained through cooperation with Bureau of the Census. Figures for 1938 not yet available; estimate of value included in total value of nonmetallic products.

[14] Includes brown coal and lignite, and anthracite mined elsewhere than in Pennsylvania.

[15] According to National Bituminous Coal Commission.

[16] Value is estimated from various sources and includes selling expenses.

[17] Value included in total value of nonmetallic products; Bureau of Mines not at liberty to publish figures.

[18] No canvass. Estimate of value included in total value of nonmetallic products.

[19] Gypsum mined; value as sold (crude and calcined). Comparable value for later years not available.

[20] Gypsum mined; value of crude at mine as reported by producers. Comparable value for years prior to 1937 not available.

[21] Value included in total value of nonmetallic products. For details of production in fiscal years see chapters on Helium.

[22] Largely for use in manufacture of pigments. Figures for quantity of pigment not available.

[23] Canvass discontinued after 1915. Figures for iron ore sold for paint given in footnote 12.

[24] Sublimed blue lead, sublimed white lead, leaded zinc oxide, and zinc oxide.

[25] Equivalent as $K_2O$.

[26] Figures for soapstone used as dimension stone included in figures for stone.

[27] From copper and zinc smelters and zinc roasters and from roasting of high-sulfide gold and silver concentrates.

[28] Figures not yet available; estimate of value included in total value of nonmetallic products.

[29] Includes value of following products. Figures are shown wherever Bureau of Mines is at liberty to publish them.

1936: Chats (3,919,300 short tons, valued at $666,000), flint lining for tube mills, pebbles for grinding, silica sand and sandstone (finely ground) (354,505 short tons, $2,121,785), and sulfur ore (13 long tons).

1937: Natural sulfonated bitumen, chats (5,976,040 short tons, $624,111), flint lining for tube mills, optical fluorspar (50 pounds, $120), pebbles for grinding, silica sand and sandstone (finely ground) (328,156 short tons, $1,996,528), and sulfur ore (221 long tons, $2,296).

1938: Natural sulfonated bitumen, chats (2,836,700 short tons, $414,300), flint lining for tube mills, optical fluorspar (5 ounces, $5), pebbles for grinding, and silica sand and sandstone (finely ground) (237,167 short tons, $1,425,445).

[1] Figures for earlier years not available.
[2] Coal, natural gas, natural gasoline, petroleum.
[3] Subject to revision.

Digitized by Google

The sum of the following State totals does not reach the total for the United States given in the preceding table partly because figures for certain of the products included in the United States total are not available by States of origin. This fact is brought out in the opening text of this chapter and in the second table following.

In addition, there are many factors (the more important discussed in the opening text) that account for the disagreement between the sum of the State totals and the grand total for the United States, by products. Chief among these are: (1) The use of iron ore values in State totals and pig iron values in United States total; (2) the use of mine figures for gold, silver, copper, lead, and zinc in the State totals and mint and smelter figures (supplemented by the value of byproduct sulfuric acid from copper and zinc smelting and zinc roasting and the value of zinc and lead pigments made in large part direct from ores) in the United States total; and (3) the inclusion of estimates in the United States total for a few products for which no canvass has been conducted for many years and for which no estimate by States is made.

Many other less important differences are involved, but both State and United States totals are as complete and definite as seems possible with the data available. The practice is consistent from year to year, and it is believed that the reader can determine readily just what minerals are covered by the total concerned.

In every table each mineral produced is listed, and all figures are shown except those that the Bureau of Mines is not at liberty to publish.

*Mineral products of the United States and principal producing States in 1937*

[See second and third paragraphs of this chapter]

| Rank in value | Product | Principal producing States [1] | |
|---|---|---|---|
| | | In order of quantity | In order of value |
| 17 | Aluminum | New York, Tennessee, North Carolina | Rank same as for quantity. |
| (2) | Antimonial lead | Not separable by States | Not separable by States. |
| 76 | Antimony ore | Idaho, Alaska, Nevada, Washington | Alaska, Idaho, Nevada, California. |
| 62 | Arsenious oxide | Montana, Utah, Idaho | Rank same as for quantity. |
| 67 | Asbestos | Vermont, Arizona, Maryland, North Carolina | Do. |
| | Asphalt: | | |
| 38 | Native | Oklahoma, Kentucky, Texas, Alabama | Utah, Kentucky, Oklahoma, Texas. |
| 20 | Oil | Not separable by States | Not separable by States. |
| 42 | Barite (crude) | Missouri, Georgia, Tennessee, California | Rank same as for quantity. |
| 40 | Bauxite | Arkansas, Alabama, Georgia | Do. |
| 57 | Bismuth | Not separable by States | Not separable by States. |
| 90 | Bitumen (natural sulfonated) | Utah | Rank same as for quantity. |
| 29 | Borates | California | Do. |
| 32 | Bromine | Michigan, North Carolina, West Virginia, California | Do. |
| 34 | Cadmium | Not separable by States | Not separable by States. |
| 50 | Cadmium compounds | do | Do. |
| 52 | Calcium-magnesium chloride | Michigan, West Virginia, Ohio | Rank same as for quantity. |
| 8 | Cement | Pennsylvania, California, Michigan, Texas | Pennsylvania, California, Texas, Michigan. |
| 59 | Chats | Oklahoma, Missouri, Kansas | Rank same as for quantity. |
| 86 | Chromite | California, Oregon | Do. |
| | Clay: | | |
| 11 | Products (other than pottery and refractories) | | Ohio, Pennsylvania, California, Illinois. |
| 25 | Raw (sold by producers) | Pennsylvania, Missouri, Georgia, Ohio | Georgia, Pennsylvania, Missouri, Kentucky. |
| 2 | Coal: | | |
| | Bituminous | West Virginia, Pennsylvania, Illinois, Kentucky | Pennsylvania, West Virginia, Illinois, Kentucky. |
| | Pennsylvania anthracite | Pennsylvania | Rank same as for quantity. |
| 5 | Coke | Pennsylvania, Ohio, Indiana, New York | Pennsylvania, Indiana, Ohio, New York. |
| 7 | Copper | Arizona, Utah, Montana, Nevada | Rank same as for quantity. |
| 46 | Diatomite | California, Oregon, Washington, New Jersey | Do. |
| 92 | Emery | New York | Do. |
| 51 | Feldspar (crude) | North Carolina, Colorado, South Dakota, New Hampshire | Do. |
| 14 | Ferro-alloys | Pennsylvania, New York, Ohio, West Virginia | Pennsylvania, New York, West Virginia, Ohio. |
| 85 | Flint lining for tube mills | Minnesota | Rank same as for quantity. |
| 37 | Fluorspar | Kentucky, Illinois, Colorado, New Mexico | Illinois, Kentucky, Colorado, New Mexico. |
| 41 | Fuller's earth | Georgia, Florida, Texas, Illinois | Rank same as for quantity. |
| 65 | Garnet (abrasive) | New York, New Hampshire, North Carolina | Do. |
| (3) | Gems and precious stones | No canvass for 1937 | No canvass for 1937. |
| 9 | Gold | California, Alaska, South Dakota, Colorado | Rank same as for quantity. |

|---|---|---|---|
| 88 | Graphite: | | |
| | Amorphous | Nevada, Michigan | Do. |
| | Crystalline | Texas, Montana | Montana, Texas. |
| 61 | Grindstones and pulpstones | Ohio, West Virginia, Washington | Rank same as for quantity. |
| 33 | Gypsum (crude) | New York, Michigan, Iowa, Texas | New York, Michigan, Iowa, Virginia. |
| 80 | Helium | Texas | Rank same as for quantity. |
| 72 | Iodine (natural) | California | Do. |
| | Iron: | | |
| 6 | Ore | Minnesota, Michigan, Alabama, Pennsylvania | Minnesota, Michigan, Alabama, Wisconsin. |
| 3 | Pig | Pennsylvania, Ohio, Indiana, Illinois | Rank same as for quantity. |
| 56 | Sinter | Tennessee | Do. |
| (4) | Kyanite | No figures available | No figures available. |
| 18 | Lead | Missouri, Idaho, Utah, Oklahoma | Rank same as for quantity. |
| 21 | Lime | Ohio, Pennsylvania, Missouri, West Virginia | Do. |
| 82 | Lithium minerals | South Dakota | Do. |
| 49 | Magnesite (crude) | Washington, California | Do. |
| 55 | Magnesium | Michigan | Do. |
| 84 | Magnesium hydrate (brucite) | Nevada | Do. |
| 47 | Magnesium salts (natural) | Michigan, California, Washington, West Virginia | Do. |
| 54 | Manganese ore | Montana, Arkansas, Tennessee, Virginia | Montana, Tennessee, Arkansas, Virginia. |
| 36 | Manganiferous ore | Minnesota, Montana, New Mexico, Colorado | Rank same as for quantity. |
| 71 | Manganiferous zinc residuum | New Jersey | Do. |
| | Marl: | | |
| 79 | Calcareous | West Virginia, Wisconsin, Virginia, North Carolina | West Virginia, North Carolina, Virginia, Nevada. |
| 73 | Greensand | New Jersey | Rank same as for quantity. |
| 48 | Mercury | California, Oregon, Texas, Arkansas | Do. |
| 58 | Mica | North Carolina, Georgia, California, Virginia | North Carolina, Georgia, Connecticut, Virginia. |
| | Scrap | do | North Carolina, Georgia, Virginia, California. |
| | Sheet | North Carolina, Connecticut, New Hampshire, Virginia | North Carolina, Connecticut, New Hampshire, New Mexico. |
| 89 | Millstones | | New York, Virginia. |
| 24 | Mineral paints (zinc and lead pigments) | Pennsylvania, Kansas, Illinois, Ohio | Rank same as for quantity. |
| (3) | Mineral waters | No canvass for 1937 | No canvass for 1937. |
| 23 | Molybdenum | Colorado, Utah, Arizona, New Mexico | Rank same as for quantity. |
| 4 | Natural gas | Texas, California, Louisiana, Oklahoma | Texas, California, West Virginia, Louisiana. |
| 13 | Natural gasoline | California, Texas, Oklahoma, Louisiana | Rank same as for quantity. |
| 75 | Nickel | Not separable by States | Not separable by States. |
| 77 | Oilstones, etc | New Hampshire, Ohio, Indiana, Arkansas | Arkansas, Ohio, Indiana, New Hampshire. |
| (4) | Olivine | No figures available | No figures available. |
| (5) | Ores (crude), etc.: | | |
| | Copper | Utah, Arizona, Nevada, Michigan | Value not available. |
| | Dry and siliceous (gold and silver) | Alaska, California, Nevada, Colorado | Do. |
| | Lead | Missouri, Idaho, Utah, Colorado | Do. |
| | Lead-copper | Nevada, Colorado, New Mexico, Arizona | Do. |
| | Zinc | Oklahoma, Kansas, Tennessee, New Jersey | Do. |
| | Zinc-lead | Oklahoma, Kansas, Idaho, Utah | Do. |
| 68 | Peat | New Jersey, New York, Florida, Michigan | Florida, New Jersey, Michigan, Ohio. |

[1] Rank of States in metal production (except aluminum, ferro-alloys, and pig iron) arranged according to mine reports, not smelter output.
[2] Separate figures for antimonial lead from primary sources not available.
[3] No canvass for 1937.
[4] No figures available.
[5] Value not available.

*Mineral products of the United States and principal producing States in 1937*—Continued

| Rank in value | Product | Principal producing States | |
|---|---|---|---|
| | | In order of quantity | In order of value |
| 91 | Pebbles for grinding | Minnesota | Rank same as for quantity. |
| 1 | Petroleum | Texas, California, Oklahoma, Louisiana | Texas, Oklahoma, California, Louisiana. |
| 26 | Phosphate rock | Florida, Tennessee, Idaho, Montana | Rank same as for quantity. |
| 43 | Platinum and allied metals | Alaska, California, Oregon | Do. |
| 28 | Potassium salts | New Mexico, California, Maryland, Utah | Do. |
| 69 | Pumice | Kansas, California, Nebraska, Oklahoma | California, Kansas, Nebraska, Oklahoma. |
| 45 | Pyrites | Tennessee, Virginia, New York, California | Rank same as for quantity. |
| 22 | Salt | Michigan, New York, Ohio, Louisiana | Michigan, New York, Louisiana, Kansas. |
| 12 | Sand and gravel | Illinois, California, New York, Michigan | Pennsylvania, Illinois, Washington, California. |
| 53 | Sand-lime brick | New York, Massachusetts, Minnesota, Michigan | New York, Massachusetts, Michigan, Minnesota. |
| 63 | Selenium | Not separable by States | Not separable by States. |
| 78 | Silica (quartz) | Ohio, Tennessee, North Carolina, California | Rank same as for quantity. |
| 44 | Silica sand and sandstone (finely ground). | Illinois, New Jersey, Pennsylvania, Ohio | Illinois, New Jersey, Ohio, West Virginia. |
| 16 | Silver | Idaho, Utah, Montana, Arizona | Rank same as for quantity. |
| 31 | Slate | | Pennsylvania, Vermont, Maine, New York. |
| 27 | Sodium salts (other than NaCl) (natural). | California, Texas, Wyoming | Rank same as for quantity. |
| 10 | Stone | Pennsylvania, Michigan, New York, Ohio | Pennsylvania, New York, Ohio, Illinois. |
| 19 | Sulfur | Texas, Louisiana, California, Utah | Rank same as for quantity. |
| 30 | Sulfuric acid from copper and zinc smelters and roasters and from roasting of high-sulfide gold and silver concentrates. | Pennsylvania, Tennessee, Illinois, Arizona | Pennsylvania, Illinois, Tennessee, Arizona. |
| 93 | Sulfur ore | Nevada, Colorado | Rank same as for quantity. |
| 39 | Talc and ground soapstone[6] | New York, Vermont, California, North Carolina | New York, California, Vermont, North Carolina. |
| 87 | Tantalum ore | South Dakota, North Carolina, New Mexico, Colorado | Rank same as for quantity. |
| 83 | Tellurium | Not separable by States | Not separable by States. |
| 74 | Tin | Alaska, Wyoming, South Dakota, South Carolina | Rank same as for quantity. |
| | Titanium ore: | | |
| 81 | Ilmenite | Virginia | Do. |
| 66 | Rutile | Virginia, Arkansas | Do. |
| 64 | Tripoli | Missouri, Illinois, Oklahoma, Arkansas | Do. |
| 35 | Tungsten ore | Nevada, California, Arizona, Colorado | Do. |
| 60 | Uranium and vanadium ores | Arizona, Colorado, Utah | Colorado, Arizona, Utah. |
| 70 | Vermiculite | Montana, Colorado, Wyoming | Rank same as for quantity. |
| 15 | Zinc | Oklahoma, New Jersey, Kansas, Idaho | Do. |

[6] Exclusive of soapstone used as dimension stone (all from Virginia), which is included in figures for stone.

*States and their principal mineral products in 1937* [1]

[See second and third paragraphs of this chapter]

| State | Rank | Principal mineral products in order of value |
|---|---|---|
| Alabama | 20 | Coal, iron ore, cement, clay products. |
| Alaska | 28 | Gold, copper, coal, silver. |
| Arizona | 14 | Copper, gold, silver, lead. |
| Arkansas | 31 | Petroleum, coal, bauxite, natural gas. |
| California | 3 | Petroleum, natural gas, gold, natural gasoline. |
| Colorado | 18 | Coal, molybdenum, gold, silver. |
| Connecticut | 45 | Stone, clay products, sand and gravel, lime. |
| Delaware | 50 | Clay products, stone, sand and gravel, raw clay. |
| District of Columbia | 49 | Clay products, stone. |
| Florida | 34 | Phosphate rock, stone, cement, sand and gravel. |
| Georgia | 35 | Stone, raw clay, clay products, cement. |
| Idaho | 24 | Silver, lead, zinc, gold. |
| Illinois | 9 | Coal, petroleum, stone, sand and gravel. |
| Indiana | 19 | Coal, cement, stone, clay products. |
| Iowa | 29 | Do. |
| Kansas | 7 | Petroleum, natural gas, zinc, coal. |
| Kentucky | 11 | Coal, natural gas, petroleum, stone. |
| Louisiana | 6 | Petroleum, natural gas, sulfur, natural gasoline. |
| Maine | 43 | Stone, sand and gravel, cement, slate. |
| Maryland | 37 | Coal, sand and gravel, cement, clay products. |
| Massachusetts | 38 | Stone, sand and gravel, lime, clay products. |
| Michigan | 12 | Iron ore, petroleum, copper, cement. |
| Minnesota | 8 | Iron ore, manganiferous ore, stone, sand and gravel. |
| Mississippi | 42 | Natural gas, sand and gravel, clay products, raw clay. |
| Missouri | 21 | Lead, coal, cement, stone. |
| Montana | 15 | Copper, silver, petroleum, gold. |
| Nebraska | 41 | Cement, stone, sand and gravel, clay products. |
| Nevada | 25 | Copper, gold, silver, tungsten ore. |
| New Hampshire | 47 | Stone, clay products, sand and gravel, feldspar. |
| New Jersey | 27 | Zinc, clay products, sand and gravel, stone. |
| New Mexico | 17 | Petroleum, copper, natural gas, potassium salts. |
| New York | 16 | Petroleum, natural gas, stone, cement. |
| North Carolina | 36 | Stone, clay products, bromine, sand and gravel. |
| North Dakota | 46 | Coal, sand and gravel, clay products, stone. |
| Ohio | 10 | Coal, clay products, natural gas, stone. |
| Oklahoma | 4 | Petroleum, natural gas, natural gasoline, zinc. |
| Oregon | 40 | Gold, stone, cement, sand and gravel. |
| Pennsylvania | 2 | Coal, petroleum, natural gas, cement. |
| Rhode Island | 48 | Stone, sand and gravel, clay products, lime. |
| South Carolina | 44 | Stone, clay products, raw clay, sand and gravel. |
| South Dakota | 32 | Gold, stone, cement, sand and gravel. |
| Tennessee | 26 | Coal, cement, stone, zinc. |
| Texas | 1 | Petroleum, natural gas, sulfur, natural gasoline. |
| Utah | 13 | Copper, gold, lead, silver. |
| Vermont | 39 | Stone, slate, lime, talc. |
| Virginia | 22 | Coal, stone, zinc, clay products. |
| Washington | 30 | Sand and gravel, coal, cement, stone. |
| West Virginia | 5 | Coal, natural gas, petroleum, stone. |
| Wisconsin | 33 | Iron ore, stone, sand and gravel, cement. |
| Wyoming | 23 | Petroleum, coal, natural gas, natural gasoline. |

[1] In this table iron ore, not pig iron, is taken as the basis of iron valuation, and for other metals mine production (recoverable content of metals) is the basis.

*Prices of gold, silver, copper, lead, and zinc, 1933–38* [1]

| Year | Gold [2] | Silver [3] | Copper [4] | Lead [4] | Zinc [4] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1933 | $25.56 | $0.350 | $0.064 | $0.037 | $0.042 |
| 1934 | 34.95 | [5].646+ | .080 | .037 | .043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [5].646+ | .098 | .046 | .048 |

[1] Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ per fine ounce. For table of prices for silver, copper, lead, and zinc from 1850 to 1931, by years, see Mineral Resources, 1931, pt. 1, p. A115.

[2] 1933–34: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934.

[3] 1933: Average New York price for bar silver; 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[4] Yearly average weighted price of all grades of primary metal sold by producers.

[5] $0.64646464.

## STATE TABLES

[See second and third paragraphs of this chapter]

*Mineral production of Alabama, 1936–37*

| Product | 1936 | | 1937 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Asphalt (native)—short tons | (1) | (1) | (1) | (1) |
| Bauxite—long tons | (1) | (1) | (1) | (1) |
| Cement—barrels | [2] 3,823,246 | [2] $5,597,211 | [2] 4,403,459 | [2] $6,165,974 |
| Clay: | | | | |
| Products (other than pottery and refractories) | | [3] 1,818,513 | | [3] 2,077,606 |
| Raw (sold by producers)—short tons | 79,365 | 93,157 | 76,584 | 99,730 |
| Coal—do | [4] 12,229,287 | [4] 26,046,000 | [4] 12,440,322 | [5] 29,857,000 |
| Coke—do | 3,089,622 | [6] 8,774,694 | 4,259,771 | [6] 13,275,098 |
| Copper—pounds | 14,000 | 1,288 | 7,000 | 847 |
| Ferro-alloys—long tons | 27,931 | [6] 1,697,712 | 20,470 | [6] 1,455,967 |
| Gold—troy ounces | 4,726 | 165,410 | 2,460 | 86,096 |
| Iron: | | | | |
| Ore—long tons | 4,259,804 | 6,838,016 | 6,350,316 | 10,747,967 |
| Pig—do | 2,061,534 | [6] 30,942,051 | 2,528,785 | [6] 42,188,993 |
| Lime—short tons | 177,582 | 1,034,110 | 176,085 | 964,400 |
| Manganese ore—long tons | 572 | 9,558 | 289 | 8,448 |
| Manganiferous ore—do | 540 | 5,132 | 428 | 2,884 |
| Mica, sheet—pounds | (1) | (1) | | |
| Mineral waters—gallons sold | (7) | (7) | (7) | (7) |
| Ore (dry and siliceous) (gold and silver)—short tons | 30,829 | (8) | 20,173 | (8) |
| Sand and gravel—do | 1,259,344 | 507,257 | 1,489,131 | 695,858 |
| Silver—troy ounces | 869 | 673 | 457 | 353 |
| Stone—short tons | [9] 1,234,490 | [9] 1,675,428 | [9] 1,500,860 | [9] 1,573,890 |
| Miscellaneous [10] | | 960,935 | | 1,237,940 |
| Total value, eliminating duplications | | 44,752,688 | | 53,518,993 |

[1] Value included under "Miscellaneous."
[2] Exclusive of puzzolan, value for which is included under "Miscellaneous."
[3] Figures obtained through cooperation with Bureau of the Census.
[4] According to National Bituminous Coal Commission.
[5] Value is estimated from various sources and includes selling expenses.
[6] Value not included in total value for State.
[7] No canvass.
[8] Not valued as ore; value of recoverable metal content included under the metals.
[9] Exclusive of granite in 1936 and of dimension limestone in 1937, value for which is included under "Miscellaneous."
[10] Includes minerals indicated by "1", "3", and "9" above.

*Mineral production of Alaska, 1936–37*

| Product | 1936 | | 1937 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Antimony ore (concentrates)—short tons | | | (1) | (1) |
| Arsenic—do | (2) | (2) | (2) | (2) |
| Coal—do | [3] 136,593 | [3] $574,000 | [4] 131,600 | [4] $552,700 |
| Copper—pounds | 37,700,000 | 3,468,400 | 34,672,000 | 4,195,312 |
| Gold—troy ounces | 540,580 | 18,920,300 | 627,940 | 21,977,900 |
| Lead—short tons | 941 | 86,572 | 823 | 97,114 |
| Ores (crude), etc.: | | | | |
| Copper—do | 143,132 | (5) | 139,279 | (5) |
| Dry and siliceous (gold and silver)—do | 4,466,644 | (5) | 4,580,923 | (5) |
| Lead—do | 3 | (5) | | |
| Platinum and allied metals—troy ounces | 2,740 | 130,793 | 5,431 | 313,367 |
| Sand and gravel—short tons | (1) | (1) | (1) | (1) |
| Silver—troy ounces | 484,306 | 375,095 | 494,340 | 382,372 |
| Stone—short tons | 21,970 | 31,747 | [6] 38,450 | [6] 59,845 |
| Tin (metallic equivalent)—do | 113 | 105,000 | 186 | 202,300 |
| Miscellaneous | | 45,807 | | 147,048 |
| Total value, eliminating duplications | | 23,737,714 | | 27,927,958 |

[1] Value included under "Miscellaneous."
[2] Figures not available.
[3] According to National Bituminous Coal Commission.
[4] According to the Alaskan Branch of the Geological Survey.
[5] Not valued as ore; value of recoverable metal content included under the metals.
[6] Exclusive of dimension unclassified stone, value for which is included under "Miscellaneous."

| Trans-Olzan Silesian iron and steel industry | 55 |
| Hungary | 56 |
| Czech contribution of minerals | 56 |
| Italy | 56 |
| Conditions during 1938 | 56 |
| Financing program of self-sufficiency | 57 |
| Iron and steel industry | 57 |
| Nonferrous metals | 58 |
| Other minerals | 60 |

Although political developments during 1938 deserve paramount consideration in any world review of the year, an analysis of the gains and losses in terms of mineral raw materials sustained by certain countries illustrates the relative importance of political or commercial control of adequate mineral resources to the economic well-being of any nation.

Since the world depression reached its lowest level in 1933, policies adopted by many countries, but especially by certain major industrial powers, have been directed toward improvement of their national economic structures through whatever means that objective might be accomplished in the light of constant changes in world conditions. Throughout 1938 determined efforts in this direction on the part of Germany and Italy, for example, to attain approximate economic self-sufficiency conflicted with national economic policies of other industrial nations that are more nearly self-sufficient in their domestic supplies of raw materials.

Economic devices, governmentally inspired and administered, such as foreign exchange controls, quota restrictions, production-consumption controls, export-import license requirements, bilateral trade agreements, and barter trade, adopted by many countries during the past few years were applied in many instances more rigidly and extensively during 1938, especially in Germany, Italy, and Japan.

Although national policies in effect during 1938 in the aforementioned countries may have had a more powerful world-wide influence or significance, certain developments in other countries also directly affected world production of and international trade in large tonnages of a diversified group of essential and in most instances strategic mineral raw materials. A number of examples may be cited. On March 19, 1938, the Mexican Government announced the expropri-

Digitized by Google

ation of Mexican properties belonging to American and British companies engaged in the production of petroleum in Mexico on the ground that these concerns had engaged in activities that were damaging to the national economy of Mexico; no satisfactory settlement was reached by the end of the year. The civil strife in Spain that began in July 1936 continued throughout 1938, and while production of and foreign trade in mercury, lead, and iron and copper pyrites, of which Spain is an important producer and exporter, did not cease, the difficulties of shipment were more pronounced during 1938. Disturbed internal conditions in China throughout 1938 affected international trade in tungsten and antimony in a manner somewhat similar to that evident in the Spanish situation.

*Conflicting foreign trade policies evident.*—Changes in economic and political conditions throughout the world during the past few years explain, in part at least, the adoption by certain industrial countries that lack adequate domestic supplies of raw materials of national policies whose objective is maximum self-sufficiency and minimum dependence on foreign countries. Germany and Italy are outstanding examples of countries that have adopted this theory of economic self-preservation. Opposed to and in conflict with this planned and governmental-directed renunciation of free trade is the policy that prevails in other major industrial countries of the world and that is based on the use of comparative cost advantages in the operation of international trade. The latter policy naturally places the countries involved in a position somewhat dependent on one another as regards their national economic welfare. The reciprocal trade program of the United States, as provided for in the Trade Agreements Act of June 12, 1934, and extended for 3 years from March 1, 1937, may be accepted as representing the most constructive policy in operation during 1938 directed toward the solution of problems confronting all nations that rely to any extent on foreign trade as an essential factor in their national economy.

The Central-European situation during 1938, with emphasis on the mineral wealth gained by Germany, Poland, and Hungary at the expense of the former Republics Austria and Czechoslovakia, represents an excellent example of the influence on a country's national economy of the possession or lack of adequate domestic supplies of essential mineral raw materials and, with particular reference to Germany, the world-wide effect of policies, whose expressed objective is economic self-sufficiency.

## GERMANY

*Germany's trade policy.*—Germany is an outstanding example among industrial nations of a country whose domestic economy and industrial progress depend on foreign trade, with maximum exports of manufactured products offsetting essential imports of raw materials. In the absence of adequate foreign credits, Germany has developed a foreign trade system of purchasing required raw materials from countries willing to accept German goods as payment. This barter policy during the past few years has resulted in a shifting of the positions of Germany's foreign customers, and while trade with other major industrial countries has declined trade with other countries that produce certain raw materials and import finished products has improved. This shift in foreign trade, and the extent of Germany's dependence on imported raw materials, may be illustrated by the following examples:

The general decline in business in many of the minor industrial countries during the past few years has been a factor favorable to Germany in the development of its present foreign trade system. The dependence of certain nonindustrial countries on imports of manufactured products and their ability to furnish certain essential raw materials have resulted in the establishment of a definite barter relation between import and export prices in Germany that cannot be reconciled with prevailing world market prices for the products involved. With declining export proceeds, Germany has been able to maintain its imports of raw materials at a relatively high level through the medium of bilateral trade agreements with numerous countries willing to accept manufactured products in return for raw materials required by German industry. According to the German Institute for Business Research, "The barter relation between export and import prices grew steadily worse during the period from 1932 to the spring of 1937

Digitized by Google

but since then, as a result of the world business decline, the relation has become more favorable to Germany."

*Austria's contribution to the mineral wealth of Germany.*—What did Germany gain in mineral wealth that may facilitate its drive toward self-sufficiency when on March 13, 1938, a decree was issued declaring Austria to be a State of Greater Germany? At that time, in consequence of the World War, Austria already had lost many important mining districts to Czechoslovakia, Yugoslavia, Poland, and Italy. Like Germany, Austria had depended largely on its export trade to furnish the means, in terms of cash or foreign credits, for obtaining deficient mineral products. However, unlike Germany, where the opposite attitude is an outstanding feature of the New Plan announced in the autumn of 1934 and the Four-Year Plan inaugurated toward the end of 1936, Austria made no serious effort to replace essential imports by substitute materials of domestic origin or to develop under Government direction low-grade, noncommercial domestic mineral deposits. Austria for some years has produced an exportable surplus of iron ore, magnesite, graphite, and talc. The iron ore production—nearly 2 million tons in 1937—without doubt can be more than doubled. One of the most difficult barriers Germany has to hurdle in its drive toward self-sufficiency is the inability to obtain an adequate supply of iron ore from domestic sources. In 1937 Germany imported 20,620,876 metric tons of iron ore and during 1938, 21,927,539 metric tons; the 1938 figure indicates clearly Germany's dependence on foreign sources of supply, as Austria's output after March 1938 was "of domestic origin." The iron ore reserves of Austria probably represent the most valuable mineral asset acquired by Germany from that country. Not unimportant, however, was the acquisition of Austria's magnesite deposits; the annual output has for years maintained Austria in the position of world's largest producer of this mineral. In 1937 Germany imported 178,756 metric tons of magnesite, all grades, while Austria produced over 400,000 tons of crude magnesite and supplied Germany with less than 40 percent of the latter's total annual imports; obviously Germany should be now self-sufficient, or virtually so, in its domestic magnesite reserves. Moreover, with reference to graphite, Germany apparently has become self-sufficient through acquisition of Austria's resources. In 1937 Germany imported 7,953 metric tons of crude graphite while Austria produced more than 23,000 tons; in 1938 Greater Germany imported only 3,750 tons. Germany's imports of pig iron and ferro-alloys in 1937 were slightly less than Austria's total output, and it may be assumed that these items ultimately will disappear from the tables of essential German imports; imports in 1938 were 109,972 tons.

*Mineral wealth gained by annexation of Sudetenland.*—What economic advantages that involve mineral wealth were gained by Germany through annexation in October 1938 of the Sudeten areas in the Provinces of Bohemia and Moravia, Czechoslovakia? The Czech Republic, which came into existence in October 1918, inherited over four-fifths of the industrial resources of the former Austro-Hungarian Empire, including the lead-silver, iron ore, coal, lignite, and radium mines of Bohemia, the iron ore and oil fields of Slovakia, and the southern tip of the Silesia coal-mining district. The determination of Germany, apparent early in 1938, to acquire at least a portion of Czechoslovakia culminated first in the Munich Agreement of Septem-

Digitized by Google

ber 30, 1938, which approved the partition of Czechoslovakia, and then in its final dissolution in March 1939. Before the end of October 1938 a new German-Czech border was defined. The economic advantages to Germany were as yet questionable by the end of the year. The heavy industries, especially the Skoda armament works—the largest in Europe outside of Germany—remained just inside the Czech frontier as of December 31, 1938. However, about 94 percent of the lignite produced annually and about 12 percent of its coal output were lost to Germany by Czechoslovakia. Losses to Poland and Hungary will be summarized later. Germany's acquisition of the lignite and coal deposits in northwest Bohemia has little economic importance, as there was already within Germany a sufficiency of both. Czechoslovak lignite deposits are, however, of much higher grade than is German "brown coal."

In addition to the lignite and coal resources lost by Czechoslovakia during 1938, the State-owned radium mine at Joachimstal, Bohemia, the high-grade china clay deposits, and virtually all the china and porcelain plants of western Bohemia now belong to Germany. In 1937 Germany imported 236,898 tons of china clay, of which 75 percent originated in Czechoslovakia. The total output of Czechoslovakia in 1937 was about 360,000 tons; in 1938 Germany imported only 189,310 tons. It seems probable that this item may likewise disappear from the list of essential German imports.

*German annexation of Czech Provinces of Bohemia and Moravia.*—On March 16, 1939, the Republic of Czechoslovakia lost its identity as an independent State; the Province of Slovakia declared its independence, the Provinces of Bohemia and Moravia were annexed by Germany, and the Province of Ruthenia (Carpatho-Ukraine) was annexed by Hungary. This dissolution of Czechoslovakia added little to Germany's mineral resources, but acquisition of the Skoda armament works at Plzeň and those in Brno represents significant gains to German industry.

The mineral wealth acquired by Germany through annexation of Austria in March 1938, the Sudetenland of Czechoslovakia in October 1938, and the Czech Provinces of Bohemia and Moravia in March 1939 has relatively minor importance in the effort being made to achieve self-sufficiency. The additional territory gained would appear to make more pronounced Germany's deficiencies in the nonferrous metal group and in nonmetals, especially petroleum products.

*Trade agreement with Rumania.*—Soon after the dismemberment of Czechoslovakia, Germany negotiated a trade agreement with Rumania that was signed on March 23, 1939. This agreement is significant because of Germany's dependence on imports of petroleum products and the fact that Rumania ranks about sixth among the petroleum-producing countries of the world. The agreement provides for German-Rumanian collaboration in matters pertaining to economic planning, and from that portion of the text published economic penetration of Rumania by Germany appears inevitable. For example, the agreement stipulates that German-Rumanian companies will be organized to exploit Rumanian resources of petroleum, pyrites, chrome, manganese, and bauxite; German and Rumanian banks will collaborate in financing such mixed enterprises; and Germany will collaborate in the construction and improvement of Rumanian railways, waterways,

Digitized by Google

and other public utilities. The agreement is for a 5-year period, and if not repudiated with 1 year's notice it will continue indefinitely.

Reliable but unofficial sources report that the agreement provides for an assignment to Germany of 40 percent of Rumania's exports of petroleum products. Gasoline has been the most important petroleum product exported by Rumania to Germany; should the afore-mentioned report be correct, Germany will have to depend on other foreign sources for only one-third or less of its motor-fuel requirements.

## POLAND

*Mineral wealth gained by partition of Czechoslovakia.*—Although Sudeten territory lost by Czechoslovakia may be considered relatively unimportant to present-day German economy, the comparatively small area of about 500 square miles acquired by Poland represents a gain of paramount importance to Polish national economy. The acquisition by Poland in November 1938 of Trans-Olzan Silesia or the Olza district, a highly industrialized region containing high-grade coking-coal deposits and extensive iron and steel plants, undoubtedly will bring far-reaching benefits to the country. The predominant industries of this area are coal mining; the manufacture of iron, steel, and other metals, chemicals, and clothing; and the preparation of lumber—about 2,800 separate enterprises in all. About 75 percent of the coal and 40 percent of the steel produced formerly by Czechoslovakia came from this area.

Of the various branches of Polish industry that will benefit from the annexation of Trans-Olzan Silesia, coal mining and the iron and steel industry will gain most, the former increasing its annual output by 20 percent on the basis of 1937 figures and the latter by 55 percent in pig iron and 50 percent in steel.

*Coal-mining industry.*—The importance of the coal-mining industry in Trans-Olzan Silesia is based on extensive formations of coking coal. The deposits were the best and richest of the former Austro-Hungarian Empire, and the coking qualities of the coal prompted the establishment of important foundry and metal-manufacturing industries in this area.

The coal deposits occur in the Ostrawa-Karwina region, which forms a part of the extensive Upper Silesia coal basin, portions of which have been within the Republic of Poland since 1919, in Germany, and the remainder herein described in Czechoslovakia. The portion formerly held by Czechoslovakia and annexed by Poland in November 1938 represents one-seventh of the entire basin. The most important coal deposits of this area are centered around Karwina, Lazy, and Orlowa; the average depth of shafts is 600 meters. Coal reserves of Trans-Olzan Silesia are reported to be about 4 billion metric tons compared with 62 billion tons of former Poland; the developed reserves of the Trans-Olzan area are estimated at 250 million tons. During 1937 production in the area acquired by Poland totaled 7,352,000 metric tons as against a total Polish production of 36,000,000 tons in the same year. The coke production in 1937 was 1,156,100 metric tons as against a total Polish production of 2,126,000 tons. All coal mines in the region have modern equipment, and at least two-thirds of the coal mined is extracted by mechanical means. The coal produced in Trans-Olzan Silesia contains between 12,600 to 14,400 B. t. u. per pound and has a 65- to 80-percent yield of coke.

Digitized by Google

Various types of coke are produced in the area. Some of the plants producing special foundry coke are especially suitable for steel production, and there is a fuel coke whose quality is said to surpass that produced in Polish Upper Silesia.

*Iron and steel industry.*—Absorption of the extensive iron and steel plants and minor iron ore deposits in Trans-Olzan Silesia are of greater importance to Poland's national economy than the coal deposits acquired. The iron and steel industry of this area is based in part on iron ore deposits in the immediate neighborhood of foundries at Trzyniec. These deposits are chiefly low-grade ores containing about 30 percent iron. Annual output has not exceeded 150,000 metric tons. The industry therefore depends to a large extent on iron ore supplies from the former Province of Slovakia and on high-grade ores imported from Sweden and the Soviet Union. A well-equipped network of railways provides adequate transportation of coal and iron ore shipped from mines to industrial centers in this region.

The largest iron and steel foundry in Trans-Olzan Silesia, that at Trzyniec, is capitalized at $7,800,000, employs 5,500 workmen, and ranks among the largest European steel concerns. Founded in 1839, the plant belongs to a well-known Czechoslovak metallurgical trust, the controlling interest in which is held by the Schneider-Creusot interests of France; the latter concern also has a substantial interest in the large Skoda armament works of Czechoslovakia. This foundry produced approximately one-fourth of former Czechoslovakia's total production of iron and steel. As a member of the International Steel Export Cartel, its annual export quota has amounted to 50,000 metric tons of rolling-mill products equivalent to about 60,000 metric tons of raw steel. Since Poland's export quota as formerly fixed by the cartel was 300,000 metric tons of raw steel per year, it follows that Poland's aggregate steel exports will be increased by about 20 percent.

The Trzyniec foundry operates four blast furnaces in the production of pig iron, with an estimated annual capacity of 530,000 metric tons. Incorporation of the Trzyniec foundry into Poland will raise the country's annual pig iron production to 1,380,000 metric tons, an increase of 55 percent. The significance of this increase is especially pronounced when it is recalled that the Four-Year Plan adopted by Poland in 1937 for expansion of the iron and steel industry did not anticipate an annual production level of 1,300,000 metric tons before 1940.

The Trzyniec foundry operates 12 Martin furnaces for steel production, a Wellman-Seever tip-furnace, and a 300-ton mixer. It is estimated that Poland's production of raw steel for 1938, excluding the Trans-Olzan Silesia output, was about 1,525,000 metric tons, and it is probable that the output of present-day Poland for 1939 will reach 2,275,000 metric tons, an increase of 50 percent. As in the case of pig iron, this increase is the more significant as the Four-Year expansion plan adopted in 1937 provided for an annual production level of 2 million tons in 1940. In addition to pig iron and raw steel, the Trzyniec foundry specializes in rolling-mill products having an estimated annual capacity of 400,000 tons of semimanufactured commodities or 300,000 tons of finished manufactures as against a total annual Polish production of 1 million tons prior to annexation of this area. The bulk of semimanufactured products made at Trzyniec is for-

Digitized by Google

warded for processing to a plant that belongs to the same corporation at Bogumin.

The other iron and steel center of Trans-Olzan Silesia is Bogumin, where the Alfred Hahn Co. established a foundry 50 years ago. The controlling interest in the company is said to be held by the Rothschild interests. This foundry employes over 1,000 workmen and operates a large blast furance and four Martin furnaces with an annual capacity of 150,000 metric tons of raw steel. It also operates an extensive pipe plant, whose capacity—900,000 tons annually—exceeds that of all Polish pipe factories.

## HUNGARY

*Czech contribution to mineral wealth of Hungary.*—A new Hungarian-Czech frontier was defined on November 2, 1938. The area then lost by Czechoslovakia—about 4,200 square miles along the southern border of Slovakia and Ruthenia (Carpatho-Ukraine)—is considered less important as a source of mineral raw materials than territories acquired by Germany and Poland. After the World War Czechoslovakia acquired from Hungary iron mines that produced about 725,000 metric tons of ore annually; Hungary's acquisition in November 1938 of Czech territory involves the return to Hungary of mines producing approximately 234,000 metric tons of iron ore annually. Production from these mines has for years been discouraged by the Czech authorities, and it appears certain that output can be increased considerably.

Hungary regained the lignite or brown-coal basins in the former frontier, where it is reported production was allowed to decline when the territory was part of the Czech Republic. As Hungary already had ample reserves of lignite but imported large tonnages of bituminous coal and anthracite, the increase in lignite resources has little importance. Hungary also regained the magnesite deposits of former Czechoslovakia, but the annual output in recent years has been less than 10,000 tons of crude magnesite; therefore, this gain is relatively unimportant. Certain basalt quarries, antimony mines, and kaolin and soapstone deposits, which were in operation but had an output of slight commercial importance, were also regained by Hungary.

Acquisition of the former Czech Province of Ruthenia (Carpatho-Ukraine) in March 1939 adds little to the mineral resources of Hungary. The industrial gains by Hungary through acquisition of former Czech territory are not great. In these areas the former Czechoslovak Government encouraged agriculture but discouraged industrial development, except for minor industries connected with the processing of agricultural products. Before the World War the iron and metal industries in this area employed 15,000 workers, but this number was reduced to 3,000 by 1930. Most other industries experienced the same reduction in employment, and many industrial plants were closed by the Czech authorities.

## ITALY

*General statement relative to conditions during 1938.*—Italy's known mineral resources make it virtually impossible for that nation to become self-sufficient, regardless of Government expenditures on mine development work, subsidies to producers whose production costs

Digitized by Google

exceed world market prices, and forced substitution of domestic products for essential imports. During 1938 intensive efforts were made to increase the domestic output of coal, oil, iron ore, copper, and certain other metals, but comparatively little progress was made in this direction. With the exception of bauxite, aluminum, mercury, sulfur, and zinc Italy depends on foreign sources for a large percentage of its mineral requirements.

According to statements in the Italian press during 1938, the country is expected to become independent of coal, oil, and iron ore imports. Toward the end of 1938, the Government erected in Rome an impressive and educational exhibit—"Mostra autarchica del minerale italiana"—of the country's mineral and metal industries, said to have cost $5,000,000. All minerals on display may be found in Italy but not in sufficient tonnages of commercial grades to warrant development or to justify the conclusion that Italy is or can become self-sufficient with regard to domestic resources.

By the end of 1938, Italy was producing 1 percent of the crude oil, 5 percent of the copper, 15 percent of the coal, 25 percent of the iron, 45 percent of the manganese, and 70 percent of the lead consumed in Italy. There is practically no domestic output of nickel, chrome, tungsten, or tin. On the other hand, there is a surplus of mercury, sulfur, bauxite, aluminum, and zinc.

*Financing the program leading toward mineral self-sufficiency.*—National self-sufficiency or autarchy in the mineral industries has been a costly program for Italy, but the expressed purpose is a determination to lessen the dependence of Italy on foreign sources of supply in times of national emergency and to reduce unemployment to a minimum. To avoid depletion of its gold reserve, Italy is making strenuous efforts to increase exports of surplus mineral products and has applied restrictions on imports and uses of several mineral and metal products. The program of national self-sufficiency in minerals is administered by the Azienda Minerali e Metalli Italiana, and the latter's operating expense is borne in part by Italian banks that hold shares in the organization. On December 15, 1938, the Government announced that the program of national self-sufficiency should be effected from national savings through institutions equipped for long- and medium-term operations, principally through the Instituto Mobiliare Italiano. Credit institutions are to allocate a suitable portion of their funds for the purchase of obligations for this purpose and must assist in marketing these obligations among the Italian public. Public and private insurance organizations likewise must cooperate.

As many of the projects for increased mineral production are considered noncommercial, public funds can be obtained only through such a system of forced subscriptions from private savings.

Italy is by far the poorest of the so-called "Great Powers" of Europe in regard to natural resources; nevertheless, the Government is strenuously applying plans for self-sufficiency through stimulated domestic output and increased imports only of essential raw materials which are, in many instances, being stored for emergency use. Throughout 1938 all heavy industries operated at capacity.

*Iron and steel industry.*—The output of Italian iron ore represents about one-fourth of the requirements for the steel industry. Another 10 percent of the iron ore required is derived by treatment of pyrite

Digitized by Google

ash in electric furnaces. The remainder of the iron consumed is obtained largely through imports of scrap iron and from domestic scrap.

Application of sanctions by the League of Nations late in 1935 stimulated domestic production of iron ore to replace imports of scrap iron, which in 1935 totaled about 1,000,000 metric tons and in 1937 and 1938 averaged 550,000 tons. Early in 1938 the Government approved the reorganization of the Italian iron and steel industry along such lines as would insure the maximum degree of self-sufficiency as quickly as possible. Efforts are to be made to double the iron ore output by 1940 by increasing annual production of the Elba mines to 600,000 tons, at Cogne in Val d'Aosta to 350,000 tons, the Val d'Aspra mines from 50,000 to 100,000 tons, and the mines of Bergomastre from 50,000 to 100,000 tons; and increase to 250,000 tons a year of the Nurra iron ore deposits in northern Sardinia was also provided for. With these increases, together with the output of the smaller mines and greater use of pyrite ash, it may be possible to supply nearly one-half of Italy's iron requirements from domestic sources by 1940.

The increase in iron ore production during 1938 was less than anticipated, and imports were more than doubled to meet the requirements of the steel industry. Morocco supplied 216,212 tons, Algeria 33,676 tons, and Turkey 33,048 tons. In January 1939 a contract was made with the Franco Government of Spain for 45,000 tons of ore from Bilbao to be delivered by June 1939.

Manganese ore production in 1939 is expected to reach 50,000 tons. Imports in 1937 were 75,384 and 1938, 58,079 tons.

Pig iron output in 1938 increased about 10 percent, but imports of pig iron advanced from 22,185 tons in 1937 to 68,731 in 1938, with Spain supplying 45,504 tons in 1938 compared with only 700 in 1937.

In 1938 authorization was granted to the Societa Italiana Acciaierio Cornigliano, an affiliate of the Ansaldo Co., to erect a new steel plant at Genoa. When this is completed the bulk of the Italian iron and steel industry will be concentrated in three great establishments at Bagnoli, Piombino, and Genoa.

Imports of scrap iron during 1938 were 615,339 tons (the United States supplying 406,867 tons) compared with 545,053 in 1937. A total of 55,235 tons of scrap iron and steel was obtained domestically by demolishing old ships, most of which, however, were purchased abroad. A semi-Government institution is authorized by Royal Decree of June 1938 to purchase and distribute iron and steel scrap required by iron and steel producers. This organization maintains headquarters in Rome, and its capital is made up of contributions by the manufacturers in proportion to the raw steel and iron produced by them during the period July 1, 1936, to June 30, 1937. Imports of pig iron are controlled by the National Consortium for Raw Materials for Iron Foundries of Milan. The sale, distribution, and prices of iron and steel products within Italy are controlled by the new Italian Iron and Steel Union of Milan.

*Nonferrous metal industries.*—Among the nonferrous ores and metals, lead was outstanding in 1938, with a 10-percent increase in production of both ore and metal. Lead imports during the year totaled 8,609 metric tons compared with 10,887 tons in 1937. Germany and Mexico were the principal countries of origin. The Montevecchio mine and

Digitized by Google

the lead smelter at San Gavino in Sardinia contributed most in the increase of production.

The 12-percent increase in the production of zinc ore in 1938 was due chiefly to Government subsidy to mining companies. The lead-zinc mines in Sardinia and at Raibl in northern Italy contributed to this increase. Zinc ore exports increased about 5,000 tons in 1938. Although the 1938 output of zinc metal represents a decrease of 10 percent below the 1937 figure, it is expected that the new electrolytic zinc plant at Porto Maghera will provide a decided increase in 1939. Exports of slab zinc in 1937 amounted to 400 tons, but in 1938, 450 tons of the metal were imported. A decree of April 28, 1938, provides for a premium of 1.25 lire for each ton of zinc concentrate exported after January 1, 1938, and for each pound-sterling difference between London quotations for zinc and £19. For each ton of zinc concentrate exported, over and above the 1937 export figure, 1.25 lire per ton also is paid for each pound-sterling difference between London quotations and £23, provided the production of lead ore has increased over that of 1937, which increase must not be less than 10 percent in 1938, 20 percent in 1939, and 30 percent in 1940. These premiums are intended to stimulate the output of lead, not zinc, as there is a surplus of the latter, but because the complex ores run high in zinc, metallic lead production has not been adequate to meet domestic requirements. Both the imports and exports of lead and zinc are subject to license and are controlled by the National Metal Office, Milan. The exportation of zinc and lead is prohibited, except under license, by decree dated December 7, 1937.

Bauxite production increased slightly in 1938, and because of greater domestic consumption exports dropped 55,000 metric tons compared with those in 1937. Of importance in 1938 was the opening of new bauxite deposits at Gargone in southeastern Italy by the Societa di Montecatini.

Aluminum output was increased to 26,000 metric tons in 1938, and an even greater increase is anticipated for 1939, as the alumina and aluminum plants at Porto Maghera, Mori, and Bolzano are being enlarged. At Aurelia, near Civitavecchia, where unsuccessful attempts were made to produce alumina from lucite, the plant is being rebuilt to produce alumina from bauxite and the product will be shipped to the aluminum plant at Borgo Franco in northern Italy. Foreign trade in bauxite and aluminum are subject to license. The domestic market for aluminum is controlled by the S/A Alluminio of Milan.

The output of mercury ore in 1938 increased but production of metallic mercury decreased compared with 1937. The world market for Italian mercury was favorable throughout 1937, when export amounted to 2,172 metric tons, but in 1938 exports dropped to 1,575 tons. The decrease in 1938 was due to reduced purchases by Great Britain and the United States.

Among the nonferrous metals, the lack of an adequate domestic supply of copper is Italy's greatest handicap. Present production is derived from domestic and imported cupriferous pyrite ore. Imports of cupriferous pyrites from Spain during 1938 of 5,000 tons represents a noticeable increase from the 1,000 tons imported in 1937. Metallic copper imported in 1938 amounted to 77,333 tons, a slight increase compared with the imports during 1937.

Digitized by Google

Nickel is another metal the domestic supply of which is wholly inadequate to meet Italy's requirements. Considerable exploratory work is being conducted in the Piedmont region, where pyrrhotite veins and masses containing some nickel have been located, and in Sardinia, where extensive quartz veins containing nickel have been developed and a small output reported. Metallic nickel imports of 3,694 tons in 1938 represent an increase above the 2,822 tons imported during 1937, and it is reported that a portion of the imported raw material has been stored for future use.

Although Italy has no commercial source of tin, efforts are being made, at great expense, to develop deposits in the Arbus area, Sardinia, and at Mount Valerio in Tuscany. Metallic tin production of Italy increased from 80 metric tons in 1937 to 320 tons in 1938, but part of this is reported to be metal recovered from scrap. Metallic tin imports increased from 3,639 tons in 1937 to 4,441 tons in 1938, and, as with nickel, it is reported that a considerable portion of the metal has been stored for future use.

During the past few years in the interest of conservation, the Italian Government has regulated imports and domestic consumption of certain mineral and metal products. This policy continued throughout 1938. A royal decree dated June 16, 1938, prohibits (under certain conditions set forth in appropriate regulations) the use of copper, nickel, tin, chrome, cobalt, and their alloys in the manufacture of industrial products wherever substitutes of domestic origin may be utilized. The Government also may prohibit importation of manufactured products made of copper, nickel, tin, chrome, cobalt, and their alloys. The Italian Official Gazette of December 12, 1938, published another decree dated November 28, 1938, which limits the use of copper and its alloys in the manufacture of electric conductors and cables. This decree probably is intended to stimulate the use of aluminum of domestic origin.

*Other minerals.*—Production of crude sulfur in Italy during 1938 increased 33,000 metric tons compared with the preceding year, but exports dropped sharply in 1938. A slight increase in exports of refined sulfur occurred in 1938. Sulfur stocks at the disposal of the Italian Sales Office were greatly increased during 1938. The greatest difficulties faced by the Italian sulfur producers were the increasing competition originating outside of the American-Italian combination and the added competition from Spanish pyrite producers who are shipping increased tonnages of sulfur to Great Britain and France. It is anticipated that sulfur production from coke gas in Germany eventually will reduce imports by that country from Italy. The future outlook for the Italian sulfur industry is not particularly encouraging. All sulfur exports are controlled by the Ital-Zolfi organization in Rome.

There was little change in the statistical position of the Italian pyrite industry during 1938. The estimated output during the year was 926,000 tons, most of which originates from the mines in Tuscany. The net exports during 1938 showed a reduction to 131,912 tons from 271,308 tons in 1937. Pyrite imports are permitted only by license from Istcambi.

The principal coal mines in Italy gradually have been absorbed by the Azienda Carboni Italiana, a Government organization that administers mine development work, production, and marketing. Large expenditures were made in 1938 by this organization on development

Digitized by Google

work in the Sulcis coal field of Sardinia and in the Arsa coal field on the Pola Peninsula. Most of the mines have been mechanized and modern washeries built, and it is planned to double the output of these two coal fields by 1940. In 1938 the output of the Arsa field was 866,000 tons and that of the Sulcis field 550,000 tons. In addition to production in these two fields, the anthracite output from the La Thuile mines in Val d'Aosta and the lignite mines near Valdarno in Tuscany must be considered.

Coal imports in 1938 were 11,816,995 tons compared with 12,572,816 tons during 1937. Germany is the principal supplier, and Great Britain and Poland follow in the order named. Assuming that it takes 1⅓ tons of Italian coal to equal 1 ton of imported coal, Italy's domestic production may be estimated to represent about 13 percent of her apparent consumption. Unless the present rate of consumption is materially reduced by increased use of hydroelectric power by railways and industrial plants, it will be some years before Italy can supply from domestic sources the planned 20 percent of her coal requirements. Italy is without domestic sources of coking coal and depends principally on Germany for her requirements of coking coal and coke.

Imports of both coal and coke are controlled by the Italian State Railway Administration in Rome, commonly known as a Government monopoly which acts as the buying agent for importers and serves as distributing agent for domestic dealers and consumers. Dealers and consumers are allotted quotas based on their imports in 1934.

Production of natural crude oil in Italy during 1938 amounted to 13,200 metric tons, or less than 1 percent of the tonnage imported during the year. From the Davoli oil fields in Albania the output for 1938 was estimated at 90,000 tons, two-thirds of which was imported by Italy.

The refinery capacity in Italy nearly suffices to produce most of the output required. With the new refineries of the Azienda Nazionale Idrogenazione Combustibile in operation at Bari and Leghorn, where hydrogenation as well as the cracking process will be applied, an additional 240,000 tons of gasoline may be recovered during 1939. However, instead of obtaining the 300,000 tons of crude oil required by these plants from Albania, about 200,000 tons of this quantity will of necessity have to be imported from elsewhere.

Italian gasoline consumption in 1938 is estimated at 440,000 tons, of which 406,000 tons were furnished by Italian refineries.

The total imports of petroleum products for 1938 is estimated at about 2,500,000 tons. Of Italy's total oil imports, 70 percent enters the Mediterranian via Gibraltar.

All imports of petroleum products are controlled and quotas allotted to importing firms by the Ufficio Speziale per Combustibile Liquidi, an agency that operates under the Ministry of Corporations. This office also regulates the retail price, which at the end of 1938 was about 70 cents a gallon for gasoline.

The A. G. I. P., a Government-financed petroleum company, continued throughout 1938 exploratory drilling for oil at several points along the Po Valley and on the Great Dalac Island in the Red Sea; geological studies were also extended throughout Ethiopia and in Libia near the Egyptian frontier. There were no discoveries of importance, but the existing oil structures are reported to be favorable to oil possibilities.

Digitized by Google

On November 9, 1938, the Council of Ministers approved a second Five-Year Plan for oil exploratory work in Italy and its colonies, to be financed by the Government and carried out under the auspices of the A. G. I. P. Late in 1938 negotiations were being conducted between Italy and Mexico leading toward a barter arrangement involving the exchange of Mexican crude oil for merchant tonnage to be built in Italian shipyards.

## ACKNOWLEDGMENTS

This chapter is based on data submitted by C. W. Wright, foreign minerals specialist, Bureau of Mines, attached to the Foreign Service, Department of State, and foreign service officers of the Department of State stationed in Berlin, Frankfort on the Main, and Vienna (Germany), Warsaw (Poland), Prague (Czechoslovakia), Budapest (Hungary), and Bucharest (Rumania).

Mine production of gold in the United States (Territories included) set a new annual record in 1938, surpassing the former record made in 1915 by 352,336 ounces in quantity and $81,370,691 in value. In the 5 years (1934–38) that have passed since gold was revalued at $35 per fine ounce in terms of United States currency (compared with $20.67+ from 1837 to 1933) the domestic annual output has nearly doubled. Although final figures on the total production of gold in the world in 1938 are not yet available, preliminary data indicate that the world output also was the highest on record, having increased 49 percent since 1933. The principal gold-producing countries in 1938, in order, were the Union of South Africa, U. S. S. R., Canada, and continental United States; these four countries together produced approximately 71 percent of the total world output of gold. Silver production in the United States decreased from 72,128,397 fine ounces in 1937 to 62,873,450 in 1938. The output in 1932, the year before legislation was enacted to raise the price, was only 22,899,865 ounces. Approximately 70 percent of the total world output of silver in 1938 came from four countries—Mexico, United States, Canada, and Peru—listed in order of quantity produced.

### DOMESTIC REFINERY PRODUCTION

The figures in the following table were obtained through cooperation between the United States Bureau of the Mint and the Bureau of Mines and were agreed upon after conference and adjustment between the two Bureaus.

The totals are based on bullion deposits in the United States mints and assay offices and on returns to the Bureau of the Mint from the smelting and refining companies. The distribution is adjusted by means of information collected by the Bureau of Mines directly from the producing mines and tabulated for the mine reports discussed later. The data for the total production and in part for the distribu-

Digitized by Google

tion are obtained from records of (1) the unrefined domestic gold and silver deposited in the United States mints and assay offices, (2) the domestic gold and silver in fine bars reported by private refineries, and (3) the unrefined domestic gold and silver contained in ore and matte exported for reduction. The last item is small.

*Gold and silver produced in the United States, 1934–38, and approximate distribution, by States and Territories, in 1937 and 1938*

[1] Gold valued at $35 per fine ounce.
[2] Silver valued as follows: 1934, $0.646+ per fine ounce; 1935, $0.71875; 1936, $0.7745; 1937, $0.7735; 1938, $0.646+.

Digitized by Google

The quantity of gold reclaimed in 1937 from old jewelry, dental waste, scrap, and other material received at private refineries and the United States mints and assay offices was 1,040,227 ounces and that sold for industrial use 1,132,067 ounces, the difference (91,840 ounces) representing the quantity of new gold absorbed by the arts and industries during the year. From 1932 to 1936, inclusive, the quantity of gold returned from industrial to monetary use exceeded that issued for industrial use by 3,367,400 ounces. Secondary silver recovered in 1937 from silverware, photographic film, and other sources totaled 23,564,986 ounces and that issued for use in the industrial arts 51,292,270 ounces, indicating that 27,727,284 ounces of new silver were required for industrial use.

*Gold and silver produced in the United States, 1792–1937*

[From Report of the Director of the Mint. The estimate for 1792–1873 is by R. W. Raymond, commissioner of mining statistics, and since then by the Director of the Mint]

| Period | Gold | | Silver | |
|---|---|---|---|---|
| | Fine ounces | Value [1] | Fine ounces | Value [2] |
| 1792–1847 | 1,187,170 | $24,537,000 | 309,500 | $404,500 |
| 1848–72 | 58,279,778 | 1,204,750,000 | 118,568,200 | 157,749,900 |
| 1873–1937 | 185,277,723 | 4,057,307,600 | 3,340,725,083 | 2,529,688,502 |
| | 244,744,671 | 5,286,594,600 | 3,459,602,783 | 2,687,842,902 |

[1] Gold valued in 1934 and thereafter at $35 per fine ounce; prior thereto at $20.67+ per fine ounce. Dollar figures are rounded.

[2] Silver valued in 1934 and thereafter at Government's average buying price for domestic product: In 1934 at $0.64+ per fine ounce, in 1935 at $0.71875, in 1936 at $0.7745, and in 1937 at $0.7735.

The average commercial value per fine ounce of silver for the total recorded domestic production is $0.777.

## PRICES OF GOLD AND SILVER

*Gold.*—Under the Gold Reserve Act of 1934 the value of gold was fixed by Presidential proclamation on January 31, 1934, at $35 per fine troy ounce and has remained at that figure through 1938. From January 18, 1837,[1] through 1932, the price was $20.67+ per ounce, and in 1933 the legal coinage value was continued at $20.67+. The average weighted price per fine ounce in 1933, as computed by the Bureau of Mines, was $25.56 and in 1934, $34.95. A complete account of regulations pertaining to gold and silver in 1933–34 is given in the chapter on Gold and Silver in Minerals Yearbook, 1934 (pp. 25–46), issued by the Bureau of Mines.

*Silver.*—The Government price of $0.7757+ for newly mined silver was maintained throughout 1936 and 1937, but was reduced by Presidential proclamation on December 31, 1937 to $0.64646464+ and continued at that price through 1938. The annual average prices[2] used for domestic silver from 1932 to 1938 are as follows: 1932,

[1] For Congressional acts with reference to coinage from Apr. 2, 1792, to Jan. 31, 1934, see Minerals Yearbook, 1937, p. 113; for gold prices in London, 1931–36, p. 114.

## DOMESTIC SUPPLY

The domestic supply of new gold comes chiefly from dry and siliceous ore and from placer gravel. These two sources yielded 90 percent of the domestic gold (excluding Philippine Islands and Puerto Rico) in 1915, 80 percent in 1930, 87 percent in 1931, 93 percent in 1932, 1933, and 1934, 91 percent in 1935, 88 percent in 1936, 85 percent in 1937, and 90 percent in 1938. The proportionate output of gold from copper ore was 7 percent in 1915, 16 percent in 1930, 10 percent in 1931, 4 percent in 1932, 5 percent in 1933 and 1934, 7 percent in 1935, 10 percent in 1936, 12 percent in 1937, and 8 percent in 1938. These sources accounted for 96 to 98 percent of the gold supply in 1915 and 1930–38.

In 1915 dry and siliceous ore yielded 36 percent of the total silver; copper ore, 26 percent; lead ore, 27 percent; and zinc-lead ore, 9 percent. In 1937 dry and siliceous ores yielded 45 percent and in 1938, 52 percent; copper ore, 29 percent and 26 percent; lead ore, 7 percent and 5 percent; and zinc-lead ore, 19 percent and 17 percent. The rounded percentage figures for both 1937 and 1938 include some silver (less than 0.8 percent in each instance) from zinc ore, mixed base-metal ores, and placer gravel.

[3] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

## WORLD PRODUCTION OF GOLD AND SILVER

According to the Bureau of the Mint the world output of gold and silver from 1493 to 1937 is 1,256,992,826 fine ounces of gold valued at $27,774,074,919 and 16,446,205,815 fine ounces of silver valued at $15,137,077,346.

The following tables show the world output of gold and silver from 1934 to 1938.

*World production of gold, 1934–38, by countries, in fine ounces* [1]

## MINE REPORT

### METHOD OF COLLECTING STATISTICS

The first table in this report presents the official refinery figures of the production of gold and silver in the United States from 1933 to 1937, as agreed upon by the Bureau of the Mint and the Bureau of Mines. With the comparatively unimportant exceptions of domestic gold and silver contained in ore and matte exported for reduction during the year, these figures record the production of gold and silver bullion from domestic ore in marketable form as metals, either refined or unrefined.

To trace the gold and silver produced back to its source by States, counties, and mining districts, the Bureau of Mines systematically investigates the "mine production" of ores containing gold and silver and the output of the placer mines, the total being classified by methods of production and by kinds of ore, as well as by mining districts. The resulting figures form the basis of the mine reports.

Of the two plans for ascertaining the production of gold and silver, one is a measure of the metallurgic industry and the other of the mining industry; one reports the metal actually recovered in marketable form and the other the mine output and its recoverable content. The two methods will not produce identical results, but the figures for a period of years sufficiently long to compensate for overlap or lag should agree within allowable limits of error.

*Gold and silver produced in the United States, 1905–37, in fine ounces, according to mint and mine returns*

| Year | Mint | | Mine | |
|---|---|---|---|---|
| | Gold | Silver | Gold | Silver |
| 1905–33 | 98,362,334 | 1,683,625,006 | 97,977,476 | 1,672,297,719 |
| 1934 | 3,091,183 | 32,725,353 | 3,119,159 | 32,995,017 |
| 1935 | 3,609,283 | 45,924,454 | 3,688,832 | 48,840,669 |
| 1936 | 4,357,394 | 63,812,176 | 4,405,118 | 61,647,455 |
| 1937 | 4,804,540 | 71,941,794 | 4,834,062 | 72,128,397 |
| | 114,224,734 | 1,898,028,783 | 114,024,647 | 1,887,909,257 |

Digitized by Google

Compared with the mine reports the mint reports show a total excess of gold for the 33 years of 200,087 ounces (a difference of 0.18 percent) and a total excess of silver of 10,119,526 ounces (a difference of 0.54 percent).

## UNITS OF MEASUREMENT

All tonnage figures are short tons of 2,000 pounds "dry weight"; that is, they do not include moisture. The weight unit for gold and silver is the troy ounce (480 grains). The totals are calculated on the basis of recovered and recoverable fine gold and silver shown by assays to be contained in ore, bullion, and other material produced. Prices of gold and silver are discussed in a preceding section of this report.

## MINES PRODUCING

### LEADING GOLD PRODUCERS

The output of the 25 largest gold producers in the United States (Philippine Islands and Puerto Rico excluded) in 1938, none of which produced less than 19,700 ounces, was 2,087,123 fine ounces (49 percent of the total) compared with 2,165,642 ounces (52.5 percent of the total) in 1937. Decreases in 1938 in the quantity of gold recovered by several large copper-producing companies caused most of the reduction in the proportion of the total gold produced by the 25 largest producers. Four of the companies, working placer mines with floating connected-bucket dredges, recovered 397,471 ounces of gold; the remainder of the output of the largest producers came from lode mines.

*Largest producers of gold in the United States in 1938, in order of output* [1]

| Rank | Operator | State | Mining district | Source of gold |
|---|---|---|---|---|
| 1 | Homestake Mining Co | South Dakota | Whitewood | Dry and siliceous ore. |
| 2 | United States Smelting, Refining & Mining Co. | Alaska | Fairbanks and Nome | Dredging gravel. |
| 3 | Golden Cycle Corporation [2] | Colorado | Cripple Creek, etc | Dry and siliceous ore. |
| 4 | Alaska Juneau Mining Co | Alaska | Juneau | Do. |
| 5 | Empire Star Mines Co., Ltd | California | Grass Valley-Nevada City. | Do. |
| 6 | Idaho Maryland Mines Corporation. | do | do | Do. |
| 7 | Phelps Dodge Corporation | Arizona | Ajo, Verde, Warren | Copper ore. |
| 8 | Utah Copper Co | Utah | West Mountain | Do. |
| 9 | Yuba Consolidated Gold Fields. | California | Callahan, Oroville, Snelling, Yuba River. | Dredging gravel. |
| 10 | Natomas Co | do | Folsom | Do. |
| 11 | Capital Dredging Co | do | do | Do. |
| 12 | Black Mammoth Consolidated Mining Co. | Nevada | Silver Peak | Gold ore. |
| 13 | Howe Sound Co | Washington | Chelan | Copper ore. |
| 14 | Lava Cap Gold Mining Corporation. | California | Grass Valley-Nevada City. | Dry and siliceous ore. |
| 15 | Central Eureka Mining Co | do | Mother Lode | Do. |
| 16 | United States Smelting, Refining & Mining Co. | Utah | West Mountain and Tintic. | Zinc-lead ore, lead ore, dry and siliceous ore. |
| 17 | The Mountain Copper Co., Ltd. | California | Iron Mountain-West Belt. | Dry and siliceous ore. |
| 18 | Consolidated Coppermines Corporation. | Nevada | Robinson | Copper ore. |
| 19 | United States Smelting, Refining & Mining Co. (Gold Road). | Arizona | San Francisco | Dry and siliceous ore. |
| 20 | Carson Hill Gold Mining Corporation. | California | Mother Lode | Do. |
| 21 | Bald Mountain Mining Co | South Dakota | Trojan | Do. |
| 22 | Getchell Mines, Inc | Nevada | Potosi | Do. |
| 23 | London Mines & Milling Co | Colorado | Mosquito | Do. |
| 24 | Golden Queen Mining Co | California | Mojave | Do. |
| 25 | Summitville Consolidated Mines, Inc. | Colorado | Summitville | Do. |

[1] Philippine Islands excluded.
[2] Custom mill. Includes mainly ore from Cresson, Portland, Ajax, and other mines in Cripple Creek district, Colo., but also from other districts in Colorado.

Digitized by Google

The Benguet Consolidated Mining Co. (including the Balatoc mine, controlled by Benguet stockholders) in the Philippine Islands ranked between the Homestake Mining Co. and the United States Smelting, Refining & Mining Co. Alaska operations.

### LEADING SILVER PRODUCERS

The output of silver from the 25 leading silver-producing companies in 1938, none of which produced less than 329,000 ounces, was 44,522,432 ounces—72 percent of the total mine output of the United States (Philippine Islands and Puerto Rico excluded); in 1937 the 25 leading companies produced 51,073,186 ounces, also 72 percent of the total mine output.

*Largest producers of silver in the United States in 1938, in order of output*

| Rank | Operator | State | Mining district | Source of silver |
|---|---|---|---|---|
| 1 | Sunshine Mining Co | Idaho | Evolution | Dry and siliceous ore. |
| 2 | New Jersey Zinc Co., Empire Zinc Division. | Colorado | Battle Mountain | Copper ore. |
| 3 | Anaconda Copper Mining Co. | Montana | Summit Valley | Copper ore, zinc-lead ore. |
| 4 | Phelps Dodge Corporation | Arizona | Ajo, Verde, Warren | Copper ore. |
| 5 | United States Smelting, Refining & Mining Co. | Utah | West Mountain, Tintic. | Zinc-lead ore, lead ore, dry and siliceous ore. |
| 6 | Tintic Standard Mining Co | do | Tintic | Dry and siliceous ore, lead ore. |
| 7 | Bunker Hill & Sullivan Mining & Concentrating Co. | Idaho | Yreka | Zinc-lead ore, dry and siliceous ore. |
| 8 | Polaris Mining Co | do | Evolution | Dry and siliceous ore. |
| 9 | American Metal Co. (Presidio mine). | Texas | Shafter | Do. |
| 10 | Hecla Mining Co | Idaho | Lelande | Lead ore, zinc-lead ore. |
| 11 | Park City Consolidated Mines Co. | Utah | Blue Lodge | Zinc-lead ore. |
| 12 | Federal Mining & Smelting Co. | Idaho | Hunter, Lelande, Yreka. | Do. |
| 13 | Snyder Mines, Inc | do | Warm Springs | Do. |
| 14 | Utah Copper Co | Utah | West Mountain | Copper ore. |
| 15 | Desert Silver, Inc | Nevada | Silver Peak | Silver ore. |
| 16 | Cactus Mines Co | California | Mojave | Dry and siliceous ore. |
| 17 | Eagle-Picher Mining & Smelting Co. | Arizona | Oro Blanco | Zinc-lead ore. |
| 18 | Veta Mines, Inc | do | Ash Peak | Dry and siliceous ore. |
| 19 | Anaconda Copper Mining Co. (Flathead mine). | Montana | Hog Heaven | Do. |
| 20 | Magma Copper Co | Arizona | Pioneer | Copper ore, copper-zinc ore. |
| 21 | Tonopah Mining Co. of Nevada. | Nevada | Tonopah | Gold-silver ore. |
| 22 | Silver King Coalition Mines Co. | Utah | Uintah | Zinc-lead ore, lead ore. |
| 23 | Black Hawk Consolidated Mines Co. | New Mexico | Mogollon | Dry and siliceous ore. |
| 24 | Chief Consolidated Mining Co. | Utah | Tintic | Dry and siliceous ore, lead ore, zinc-lead ore. |
| 25 | Shenandoah-Dives Mining Co. | Colorado | Animas | Dry and siliceous ore. |

### NUMBER OF MINES

The following table indicates the number of mines that produced gold and silver in 1937 and 1938. The placers are those in which the gold and the silver in natural alloy with the gold and, in a few placers, with platinum are recovered from gravel and sand, whether by hand washing, sluicing, hydraulicking, drifting (in frozen ground or ancient buried river channels), or dredging. The lode mines are those yielding gold and silver (from ore as distinguished from gravel)

Digitized by Google

mainly from underground workings, including those that yield ore valuable chiefly for copper, lead, or zinc but that contribute precious metals as byproducts. In addition to producing mines enumerated here many properties were being prospected and developed, and many other mining claims were being held by assessment work only.

The enumeration of placer mines is less satisfactory than that of lode mines, because some are operated only temporarily and are individually small and because much of the production is made by transitory miners not regularly working placer ground. So far as possible the unit, as for lode mines, is not the operator but the mining claim or group of claims.

*Number of mines in the United States producing gold and silver, 1937–38, by States* [1]

| State | Lode | | Placer | | Total | |
|---|---|---|---|---|---|---|
| | 1937 | 1938 | 1937 | 1938 | 1937 | 1938 |
| Alabama | 2 | 1 | 2 | 2 | 4 | 3 |
| Alaska [2] | 61 | 70 | 1,177 | 1,164 | 1,238 | 1,234 |

## MINE PRODUCTION

### SUMMARY

The following table gives the mine production of gold and silver in 1937 and 1938, by States, as reported to the Bureau of Mines by the producing mines. The annual percentage gains in gold production in the years following the 69-percent increase in the price of gold are as follows: 1934 over 1933, 19 percent; 1935 over 1934, 18 percent; 1936 over 1935, 19 percent; 1937 over 1936, 9 percent; and 1938 over 1937, 7 percent. The total gain in 1938 over 1933 was 97 percent. The output of silver decreased 13 percent in 1938 from 1937 but was still 170 percent above that in 1933.

| Utah | 1864–1938 | 8,068,483 | 182,621,945 | 646,973,710 |
| Washington | 1860–1938 | 1,624,993 | 35,630,078 | 10,013,622 |
| Wyoming | 1867–1938 | 76,090 | 1,771,478 | 74,297 |
| Total, Western States | 1848–1938 | 224,544,501 | 4,869,604,678 | 3,457,803,086 |
| Alaska | 1880–1938 | 23,023,856 | 518,849,562 | 18,978,413 |
| Total, Western States and Alaska | 1848–1938 | 247,568,357 | 5,388,454,240 | 3,476,781,499 |

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67+; 1933, $25.56; 1934, $34.95; 1935–38, $35.

## ORE PRODUCTION, CLASSIFICATION, METAL YIELD, AND METHODS OF RECOVERY

The best index of lode mining is the quantity and metallic content of ore mined rather than the number of mines or operators. The following tables give details of classes of ore, metal yield in fine ounces of gold and silver to the ton, and gold and silver output by classes of ore and by methods of recovery, embracing all ores that produced gold and silver in the United States (excluding the Philippine Islands and Puerto Rico) in 1938. The individual State chapters from which these tables were compiled contain additional tables and text on the subject and may be found elsewhere in this volume.

The classification originally adopted in 1905 on the basis of smelter terminology, smelter settlement contracts, and smelter recovery has been used continuously in succeeding years, except for modifications necessitated by the improvement in recovery of metals and the lowering of grade of complex ores treated, accomplished by improved mill concentration processes. A "dry" ore is one that carries so little lead or copper that by itself in quantity it would not satisfy the requirements for the smelter charge in lead smelting or copper smelting, respectively. The copper ores include those smelting ores that contain 2.5 percent dry assay or more of copper (or less than this percentage if no other metal is present), or those ores concentrated chiefly for their copper content. The lead ores are those that contain 5 percent dry assay (minimum lead smelting charge requires 7.5 to 8.5 percent wet assay) or more of lead, irrespective of precious-metal content; an ore that carries any grade of lead exclusively is called a lead ore. Zinc smelting ores (chiefly oxides) range from 16 to 45 percent zinc; zinc concentrating ores include any grade of zinc ore that makes marketable zinc concentrate, irrespective of precious-metal content. The mixed ores are combinations of those enumerated. The smelter classification applies to concentrates.

Digitized by Google

Siliceous (silica [4] in excess of iron) gold, gold-silver, and silver ores containing too little copper, lead, or zinc to be classified as copper, lead, zinc, or mixed ores are called "dry" ores regardless of the ratio of concentration, except low-grade ore milled chiefly for its copper content and having very little or no precious-metal content (chiefly the "porphyry coppers") and ores from which separate products of lead concentrates and zinc concentrates are made. The crude ore into the mill in these two exceptional instances thus takes its name from its products—a name that is also justified by the mineralogical content and final recovery of metals. The "dry and siliceous ores" thus, by elimination, include both dry siliceous and irony, but chiefly siliceous, ores valuable for their gold and silver content, regardless of method of treatment, and dry fluxing ores carrying considerable quantities of iron and manganese oxides, or iron sulfide, and very small quantities of gold and silver. Dry and siliceous gold ores are those that by inspection are overwhelmingly of gold content; a similar qualification applies to silver ores; decision as to "gold-silver" ore is made arbitrarily on a basis of value, using the rule that the metal of lower value is not used in the bimetal classification unless its value is equal to or over one-quarter of the combined value of gold and silver.

The lead, zinc, and zinc-lead ores in most districts in the Eastern and Central States carry no appreciable quantity of gold or silver; such ores are excluded from this report.

See footnotes at end of table.

[4] Except where mineralization approaches a matte, ores in their natural state generally contain more silica than iron and usually are highly siliceous.

[1] Illinois, Michigan, Missouri, Philippine Islands, and Puerto Rico excluded.
[2] Includes magnetite-pyrite-chalcopyrite ore from Pennsylvania yielding copper concentrates carrying gold and silver.
[3] Current slag fumed.
[4] Zinc ore yielded no gold or silver.
[5] Figures cover following States—1937: New York and Tennessee; 1938: New York, North Carolina, and Tennessee.
[6] Includes 1,380,212 tons of ore leached which contained no gold or silver.
[7] Zinc-copper ore came from Arizona only.

## PLACERS

*Dredging.*—Placer gold is obtained largely from gravels handled by connected-bucket floating dredges, which recovered approximately 62 percent of the total output from placers in the United States (Philippine Islands and Puerto Rico excluded) in 1938 and 64 percent in 1937. The quantity of gold recovered by dredges from the inception of the industry as a commercial factor in 1896 to the end of 1938 is recorded as 15,822,938 ounces, originating by States as follows: California, 10,049,288 ounces; Alaska, 3,941,308 ounces (including some gold by hydraulicking); Montana, 553,129 ounces; Idaho, 453,067 ounces; Colorado, 420,387 ounces; Oregon, 371,295 ounces; and other States, 34,464 ounces. The output in 1938 was 736,424 ounces from 115 dredges, of which California produced 375,296 ounces from 48 dredges; Alaska, 278,442 ounces from 44 dredges; Idaho, 31,234 ounces from 9 dredges; Montana, 21,356 ounces from 6 dredges; Oregon, 29,006 ounces from 5 dredges; Colorado, 1,027 ounces from 2 dredges; and Nevada, 63 ounces from 1 dredge.

[1] Colorado, Idaho, Montana, Oregon, and Nevada.

*Other placer-mining methods.*—From 1932 through 1938 dragline and power-shovel excavators operated in connection with dry-land and floating amalgamating and sluicing plants have been widely used in placer mining. In 1938 approximately 26 percent of the total output of placer gold, including Alaska and excluding the Philippine Islands, was recovered at these plants, and 12 percent was produced by old-established mining methods, such as hydraulicking, drift mining, sluicing, and rocking.

Additional information on placer-mining methods may be found in the State reviews in Minerals Yearbook and Mineral Resources.

## PRODUCTION IN PHILIPPINE ISLANDS

The value of the gold produced in the Philippine Islands from 1907 to 1938, inclusive, is computed at $155,605,126. The gold production in 1938 was 903,265 ounces valued at $31,614,275 compared with 716,967 ounces valued at $25,093,845 in 1937, an increase of 26 percent. The annual value of the output from 1929 to 1938 was as follows:

*Mine production of gold in the Philippine Islands, 1929–38*

| Year | Gold (fine ounces) | Value [1] | Year | Gold (fine ounces) | Value [1] |
|---|---|---|---|---|---|
| 1929 | 160,620 | $3,320,300 | 1934 | 340,314 | $11,893,975 |
| 1930 | 179,220 | 3,704,800 | 1935 | 451,818 | 15,813,630 |
| 1931 | 182,008 | 3,762,433 | 1936 [2] | 621,968 | 21,768,880 |
| 1932 | 244,298 | 5,050,084 | 1937 [2] | 716,967 | 25,093,845 |
| 1933 | 325,039 | 8,308,009 | 1938 [2] | 903,265 | 31,614,275 |

[1] Gold valued per fine ounce as follows: Prior to 1933, $20.67; 1933, $25.56; 1934, $34.95; 1935–38, $35.
[2] Division of Statistics, Department of Agriculture and Commerce, Manila.

The largest producers of gold, in approximate order of importance in 1938 included: Balatoc Mining Co., Benguet Consolidated Mining Co., Antamok Goldfields Mining Co., Itogon Mining Co., Masbate Consolidated Mining Co., I. X. L. Mining Co., San Mauricio Mining Co., United Paracale Mining Co., Coco Grove, Inc., Demonstration Gold Mines, Ltd., Baguio Gold Mining Co., and Suyoc Consolidated Mining Co., each of which produced over 22,000 ounces of gold; in all, they produced about 734,000 ounces. Of the total gold output in 1938, lode mines yielded 853,168 ounces, gravel handled by dredges 34,973 ounces, and other placers 15,124 ounces. Two dredges, each equipped with approximately 80 4-cubic foot buckets, were operated at Paracale, Camarines Norte, by Coco Grove, Inc., and one dredge by Tambis Gold Dredging Co., Inc., at Lianga, Surigao.

The output of silver from the Philippine Islands in 1938 was 1,167,612 ounces, all produced as a byproduct of gold mining.

| World production | 114 |
| World consumption | 116 |
| Review by countries | 116 |

World rates of copper production and consumption in 1938 fell below the records attained in 1937, largely because of the unsatisfactory demand for metal in the United States. Outside of the United States consumption was larger than ever before, being 8 percent above the previous record established in 1937, while that in the United States was 41 percent below 1937 and 54 percent below the previous record consumption in 1929.

Production at domestic mines, primary smelters, and refineries in 1938 failed by about one-third to pace the 1937 rate. Demand for copper was at an extremely low level in the early months of 1938. As a consequence, production was reduced at many properties and was suspended at some others. By July output was at the lowest level of the year, being little more than one-half the rate for January.

Curtailment of output in the middle of the year resulted in bringing new supply below consumption requirements; and stocks, which were 43 percent higher at the end of May than at the beginning of the year, were reduced successively from May to the end of October a total of 103,000 tons. Production increased after July, and following the consumption peak reached in October stocks turned upward again in November and December. Inventories of refined copper at domestic primary refineries were 181,000 tons at the end of 1938 compared with 179,000 tons at the end of 1937, while those of blister and unrefined copper at smelters, in transit to refineries, and at refineries were 233,000 and 214,000 tons, respectively. According to the Copper Institute stocks of refined copper abroad fell from 211,844 tons at the

Digitized by Google

end of 1937 to 167,413 at the end of 1938. Foreign stocks declined in every month of the year except June and December. The average monthly rate of consumption abroad was very high all year, but requirements for armament and industry were unable to absorb the increased tonnages available in the final quarter, with the result, already noted, that stocks increased more than 12,000 tons in December.

The unsatisfactory level of consumption in the United States was caused largely by unfavorable industrial conditions in general and particularly by the inability of some large copper-consuming industries, such as the utility industry, to call for even their proportionate share of the total. The failure to find a solution for the problems of the railroads also deterred consumption. The record consumption abroad was due largely to the large amounts needed for armament. Statistics showing how much copper was withdrawn for stock-pile purposes are not available; but it seems safe to assume that Germany and Japan, at least, did not actually consume all the copper made available during the past 2 or 3 years. Consumption for industrial purposes abroad was restricted in several countries because of the urgent needs for military purposes. Despite the record-breaking level of foreign demand in 1937 and 1938 total requirements for copper might have been larger had political uncertainties been removed and industrial uses been permitted to expand.

Because of the better level of consumption in foreign countries in 1938 selling conditions during the year frequently were more favorable in London than in New York; exports of domestic copper were higher than in any other year since 1928 and were about equal to those in that year. According to the Copper Institute, 125,852 tons of duty-free domestic copper were sold abroad in 1938 compared with 62,798 tons in 1937. Total exports of refined copper aggregated 370,545 and 295,064 tons, respectively.

Sales of copper on the Commodity Exchange were larger than ever before as this market assumed increasing importance to the copper industry. In the last 2 months of the year, when the producers' price for copper delivered at Connecticut points was held at 11.25 cents in the face of falling demand, sales on the Commodity Exchange were 3½ times as large as producers' sales, and the discounts amounted to as much as 1 to 1.25 cents a pound. Commodity Exchange sales were 75 percent of those on the London Metal Exchange in 1938.

[1] Includes old tailings.
[2] Exclusive of Alaska, figures for which the Bureau of Mines is not at liberty to publish.
[3] Figures not yet available.
[4] Data include copper imported for immediate consumption plus material entering the country under bond.
[5] Total exports of copper, exclusive of ore, concentrates, composition metal, and unrefined copper. Exclusive also of "Other manufactures of copper," for which figures of quantity are not recorded.
[6] Revised figures.
[7] Approximate.

Several outstanding developments in the world copper industry during the last decade have had a pronounced effect on the price of copper and in the international trade in this commodity. Perhaps the most important of these has been the remarkable growth in the production of the British Empire to a point where the Empire now has an exportable surplus. Contemporaneous with this expansion there has been a substantial increase in South American production, most of which is controlled by subsidiaries of United States companies. Both sources apparently can produce copper at a cost considerably below the average cost of production in the United States; in consequence, the position formerly enjoyed by domestic producers in the international market, particularly in Great Britain, Germany, and France, has been weakened to a considerable degree. With minor exceptions, exports from the United States, have decreased steadily, and more and more domestic producers are forced to depend on the home market for absorption of their mine output. During 1938, as already has been mentioned, exports from the United States increased materially, but as this was due largely to the abnormal demand abroad for armament it can be considered only a temporary situation.

Digitized by Google

The effects of these developments on price have been twofold. First, the competition between relatively low-cost producers in the British Empire and South America has reduced our previous conceptions of normal copper prices by several cents per pound. Secondly, London has replaced New York as the dominant copper market of the world because of the afore-mentioned competition on the London metal exchange. Meanwhile the domestic producer faces the problem of preserving the home market for domestic metal under tariff protection and at the same time of marketing his surplus production abroad at a price that seldom has equaled the New York quotation. This situation has been a disturbing influence in the foreign copper market because exportation of domestic metal when the foreign price is below the domestic creates instability in the London market. Likewise, when the foreign price exceeds the domestic the export of domestic metal not only threatens a shortage in the domestic market but affects prices as well.

Another factor that has had an important influence on world price has been the ever-increasing supply of secondary copper. In the United States the differential between the domestic price of secondary and primary copper is relatively constant because the higher grades of secondary copper are directly competitive with virgin metal in some uses. For example, wire bars may be manufactured from what is known in the scrap trade as No. 1 and No. 2 copper wire and No. 1 heavy copper. In purchasing his raw material the consumer weighs the differential between scrap and virgin against the cost of refurnacing scrap. In consequence, virgin copper prices are very sensitive to changes in scrap prices. The United States leads the world as a source of scrap, and from time to time Japan, Germany, and Great Britain buy large tonnages, usually at a price slightly higher than current domestic prices. These foreign purchases of scrap add another disturbing factor to the domestic price situation.

Chile occupies a unique and powerful position in the international copper trade. The resources of copper in Chile are far greater than those developed so far in either Canada or South Africa and as a matter of fact are larger than the combined total for these two countries. It is evident from the reports published that the Chuquicamata deposit contains more metallic copper than do the combined deposits of Rhodesia and the Congo. The largest mines of Chile are controlled by citizens of the United States, and as these mines can produce copper at a price that cannot be equaled by any group of mines throughout the world on a similar tonnage basis they occupy a strategic position in the industry. Recognizing this, some of the other foreign producers at the time the International Cartel was formed argued that the Chilean output should be considered in the same category with the domestic production of the United States in that it was controlled by the United States and that due to the tariff situation the United States market was closed to all other producers.

Chile's position has effectively blocked the imposition of a British tariff on copper. When this question was discussed at the Ottawa Conference of British Dominions in 1932 a resolution was passed that, at any time the Dominions considered it expedient, a 4-cent duty should be placed upon all copper entering the British Empire other than that produced from British possessions. This tariff has never been applied.

Digitized by Google

The fact that United States producers, through their Chilean subsidiaries, could flood the international market at any time with large tonnages of copper produced at a very low figure gives them a trading advantage that unquestionably has been a factor in forestalling the British tariff and has been used to maintain Chile's quota in international trade. Fear of the disastrous competition that would result from collapse of the cartel is the major factor that will preserve it.

The price for copper ordinarily has been subjected to considerable fluctuation, and the greatest sales usually are made on a rising market. This philosophy is diametrically opposed to that of the nickel and aluminum industries, which have attempted to maintain relatively stable prices for their products for many years The theory of these industries is that wide fluctuations of price disturb the channels through which the metal flows to the consumer and that, should prices vary to a great degree, a loss of market would ensue that could not be recaptured without expending large sums of money.

In the metal trades one of the great factors invariably controlling price is substitution, which in many instances is largely a matter of price. In view of the inroads other metals are making in the consumption of copper in transmission lines and other outlets it might well be assumed that in the near future world copper producers will endeavor to meet this competition by further price stabilization.

The Bureau of Mines published a report [1] on the history, geology, prospecting, exploration, development, and mining of copper in North America.

## DOMESTIC PRODUCTION

Statistics on copper production may be compiled on a mine, smelter' or refinery basis. Mine data are most accurate for showing the geographic distribution of production; smelter figures are better for showing the actual recovery of metal and are fairly accurate for showing source of production; and refinery statistics give precise information regarding metal recovered but indicate only in a general way the source of crude materials treated. The chapter on Copper in Mineral Resources of the United States, 1930, contains a discussion of the differences among the three sets of figures.

*Copper produced from domestic ores, as reported by mines, smelters, and refineries, 1934–38, in pounds*

| Year | Mine | Smelter | Refinery |
|---|---|---|---|
| 1934 | 474, 803, 458 | 488, 454, 107 | 466, 058, 360 |
| 1935 | 760, 979, 802 | 762, 587, 340 | 676, 642, 866 |
| 1936 | 1, 229, 030, 719 | 1, 222, 819, 396 | 1, 290, 924, 195 |
| 1937 | 1, 683, 996, 000 | 1, 669, 322, 278 | 1, 644, 505, 129 |
| 1938 | 1, 115, 525, 160 | 1, 124, 656, 539 | 1, 105, 148, 323 |

### PRIMARY COPPER

*Smelter production.*—The recovery of copper by United States smelters from ores of domestic origin totaled 1,124,656,539 pounds in 1938, a decrease of 33 percent from 1937. Smelter domestic output constituted 51 percent of world production in the period 1925–29.

[1] Gardner, E. D., Johnson, C. H. and Butler, B. S., Copper Mining in North America: Bureau of Mines Bull. 405, 1938, 300 pp.

Digitized by Google

The proportion dropped sharply in the succeeding years until 1934, when it represented only 17 percent. From then it increased until it reached 32 percent in 1936 and 1937 but declined again to 25 percent in 1938.

The figures for smelter production in 1938 are based on confidential returns from all smelters handling copper-bearing materials produced in the United States. For Michigan, the sum of furnace-refined copper and copper cast into anodes for electrolytic refining is included. The figures for blister represent the fine-copper content. Some casting and electrolytic copper produced direct from ore or matte is included in the smelter production. Metallic and cement copper recovered by leaching is included in smelter production.

The precise quantity, in pounds, of copper produced by smelters in the United States and its value are shown by years for 1845–1930 in the Copper chapter of Mineral Resources of the United States, 1930.

*Copper produced in the United States from domestic ores, 1934–38*

*Mine production.*—The figures for mine production are based on reports furnished to the Bureau of Mines by all domestic mines that produce copper. Details of the method of collecting the statistics

Digitized by Google

and reasons for the discrepancy between mine-, smelter-, and refinery-production figures are given in the Copper chapter of Mineral Resources of the United States, 1930.

Mine production is more accurate than either refinery or smelter production for showing the distribution of domestic production by States and districts. It also indicates the production by calendar years more exactly because additional time is required for smelting and refining. Mine production in 1938 was 1,115,525,160 pounds, a decrease of 34 percent over that in 1937 and 37 percent below the average for 1925–29.

*Production by States and districts.*—The following tables show mine and smelter production by States for 1937 and 1938 and by districts for 1934–38. In 1938 Arizona, Utah, and Montana led in production, with 72 percent of the smelter total compared with 76 percent in 1937. If the output of Nevada and Michigan is added to the above, 87 percent of the output of the country is represented compared with 90 percent in 1937. Arizona's proportion of the total increased from 35 percent in 1937 to 37 in 1938. Utah's dropped from 24 to 20 percent, and Montana's fell from 17 to 14. Nevada's proportion was slightly lower than in 1937 while Michigan's share was nearly 2 percent more than the all-time low percentage registered in that year. Of the most important copper-producing States, Arizona, Utah, and Nevada supplied a much larger percentage of the total for 1938 than they did during the period 1845–1938, while Michigan and Montana contributed a much smaller proportion.

The Bingham (Utah) district again produced more copper than any other district in 1938, followed as in 1937 by Butte, Mont. The Bisbee (Ariz.) district stood third in 1938, having replaced Globe-Miami, Ariz., which held that position in 1937.

Details of mine production, by districts and companies, in 1938, are available in other chapters of this volume dealing with production of gold, silver, copper, lead, and zinc in the various States.

*Quantity and estimated recoverable content of copper-bearing ores.*—The following tables list the quantity and the estimated recoverable copper content of the ore produced by United States mines in 1937; figures for 1938 are not yet available. Of the total copper produced from copper ores in the United States in 1937, 85 percent was obtained from ores concentrated before smelting and 15 percent from direct-smelting ore. No ore was treated by straight leaching in 1937, but 9,724,841 tons were treated by combined leaching and flotation. Straight leaching of copper ores was resumed in 1938. The percentages for 1937 are to be compared with 80 percent obtained from concentrated ore and 20 percent from direct-smelting ores in 1936. Better prices, followed by larger-scale operations and the treatment of lower-grade ores, resulted in the higher ratio of concentrating ores to smelting ores in 1937. It is reasonable to assume that the ratio declined in 1938 with the reversal of 1937 conditions.

Close agreement between the output as reported by smelters and the recoverable quantity as reported by mines indicates that the estimated recoverable tenor is close to the actual recovery. Classification of some of the complex western ores is difficult and more or less arbitrary. "Copper ores" include not only those that contain 2.5 percent or more copper but also those that contain less than this percentage if they are valuable chiefly for copper. Mines report considerable copper from ores mined primarily for other metals. These include siliceous gold and silver ores, lead and zinc ores, and pyritic sulfur ores.

*Copper ore, old tailings, etc., sold or treated in the United States[1] in 1937, with copper, gold, and silver content in terms of recovered metals*

| State | Ore, old tailings, etc., sold or treated (short tons) | Copper produced | | Gold produced (fine ounces) | Silver produced (fine ounces) | Value of gold and silver per ton of ore |

## REFINERY PRODUCTION

The refinery output of copper in the United States in 1938 was made by 10 plants; 8 of these employed the electrolytic method and 2 the furnace process on Lake Superior copper.

There are five large electrolytic refineries on the Atlantic seaboard, three lake refineries on the Great Lakes, and four refineries west of the Great Lakes—one at Great Falls, Mont.; one at Tacoma, Wash.; one at El Paso, Tex.; and one at Clifton, Ariz. Of the above plants the lake refinery of the Quincy Mining Co. and the plant of the Phelps Dodge Corporation that produces furnace-refined copper at Clifton, Ariz., have been idle since 1933.

In addition to the plants mentioned above those at Ajo and Inspiration, Ariz., are equipped to make electrolytically refined copper direct from the liquors obtained from leaching operations; this copper is shipped as cathodes to other refineries, where it is melted and cast into merchant shapes. The Inspiration plant was idle during 1933 and 1934, but operations were resumed during the latter part of 1935. The Ajo plant has been idle since 1931.

The above 14 plants constitute what commonly are termed "regular refineries." Of these plants 10 employ the electrolytic process and 4 the furnace process. The electrolytic plants, excluding the Ajo unit which is no longer active, have a rated capacity of 1,642,000 tons of refined copper per annum. As they produced but 849,000 tons in 1938, only 52 percent of the electrolytic refining capacity was utilized.

The following tables show the production of refined copper at regular refining plants, classified according to source, grade, and form in which it is cast.

*Primary and secondary copper produced by regular refining plants in the United States and imported, 1934–38, in pounds*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Primary: | | | | | |
| Domestic:[1] | | | | | |
| Electrolytic | 414,020,483 | [2] 602,826,051 | 1,198,132,177 | [2] 1,548,857,307 | [2] 1,032,976,656 |
| Lake | 51,681,901 | [2] 73,605,212 | 91,105,431 | [2] 84,007,120 | [2] 72,021,341 |
| Casting | 355,976 | 211,603 | 1,686,587 | 11,640,702 | 150,326 |

*Copper cast in forms in the United States in 1937–38*

| Form | 1937 | | 1938 | |
|---|---|---|---|---|
| | Pounds | Percent | Pounds | Percent |
| Wire bars | 1,295,000,000 | 52.92 | 825,000,000 | 46.61 |
| Cathodes | 555,000,000 | 22.68 | 522,000,000 | 29.49 |
| Cakes | 297,000,000 | 12.14 | 215,000,000 | 12.15 |
| Ingots | 133,000,000 | 5.44 | 88,000,000 | 4.97 |
| Other forms | 167,000,000 | 6.82 | 120,000,000 | 6.78 |
| | 2,447,000,000 | 100.00 | 1,770,000,000 | 100.00 |

Besides the regular refineries, numerous plants throughout the country operate on scrap exclusively, producing metallic copper and a great variety of alloys. The output of these plants is not included in the statements of refined-copper production in the preceding tables but is included in the following statement of secondary-copper production.

*Copper sulfate.*—The production of hydrous copper sulfate or bluestone by copper refineries in the United States was 39,081,407 pounds having a copper content of 9,955,000 pounds in 1938 compared with 45,968,040 pounds having a copper content of 11,709,000 pounds in 1937.

The output of copper sulfate by plants other than the regular primary refineries was 49,819,375 pounds with a reported copper content of 12,565,000 pounds in 1938 compared with 48,538,693 pounds containing 12,235,000 pounds in 1937.

## SECONDARY COPPER

Secondary copper includes material recovered from remelting old copper and copper scrap and from the treatment of copper alloys or alloys treated without separation of the copper. The following table summarizes the production of secondary copper during the past 5 years. Further details appear in the chapter on Secondary Metals—Nonferrous.

*Secondary copper produced in the United States, 1934–38, in short tons*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Copper as metal | 220,400 | 270,000 | 260,000 | 285,600 | 192,400 |
| Copper in alloys | 157,000 | 178,900 | 224,600 | 246,500 | 167,400 |
| Total secondary copper | 377,400 | 448,900 | 484,600 | 532,100 | 359,800 |
| From new scrap | 66,500 | 87,200 | 101,900 | 123,200 | 92,500 |
| From old scrap | 310,900 | 361,700 | 382,700 | 408,900 | 267,300 |
| Percent of domestic mine output | 159 | 118 | 79 | 63 | 65 |

The production of secondary copper and that by domestic mines decreased similarly in 1938—32 percent and 34 percent, respectively—and in consequence the ratio of secondary to primary was about the same as in 1937. When mine activity was at an extremely low level in 1933 secondary output was 177 percent of mine output; it declined to 63 percent in 1937 and was 65 percent in 1938.

## CONSUMPTION AND USES

*New supply.*—The total available supply of new copper consists of the total output of primary copper by refineries plus the imports of refined copper; in 1938 it was 1,588,434,754 pounds, a 26-percent decrease from 1937. If this figure is reduced by the quantity of refined copper exported and adjusted for changes in stocks at refineries, the quantity of new copper made available for domestic consumption may be estimated. This computation is made in the table that follows. It should be noted, however, that exports and stocks include some refined secondary copper that cannot be determined separately and that actual consumption of new copper would differ from the figures shown in the table by the changes in consumers' stocks, on which data are not available.

*New refined copper withdrawn from total year's supply on domestic account, 1934–38, in pounds*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Total supply of new copper | 945, 553, 301 | 1, 213, 753, 468 | 1, 654, 540, 642 | 2, 148, 602, 618 | 1, 588, 434, 754 |
| Stock at beginning of year | 813, 000, 000 | 569, 000, 000 | 350, 000, 000 | 220, 000, 000 | 358, 000, 000 |
| Total available supply | 1, 758, 553, 301 | 1, 782, 753, 468 | 2, 004, 540, 642 | 2, 368, 602, 618 | 1, 946, 434, 754 |
| Copper exported [1] | 544, 276, 582 | 550, 012, 320 | 472, 182, 922 | 620, 791, 029 | 770, 446, 945 |
| Stock at end of year | 569, 000, 000 | 350, 000, 000 | 220, 000, 000 | 358, 000, 000 | 362, 000, 000 |
| | 1, 113, 276, 582 | 900, 012, 320 | 692, 182, 922 | [2] 978, 791, 029 | 1, 132, 446, 945 |
| Withdrawn on domestic account | 645, 276, 719 | 882, 741, 148 | 1, 312, 357, 720 | [2] 1,389, 811, 589 | 813, 987, 809 |

[1] Includes refined copper in ingots, bars, rods or other forms.
[2] Revised figures.

As shown in the foregoing table, the quantity of new copper withdrawn on domestic account in 1938 was 41 percent less than in 1937 and 54 percent less than in the record year 1929.

*Total supply.*—Adding 719,600,000 pounds of secondary copper and copper in alloys produced during the year to the 814,000,000 pounds of new refined copper withdrawn on domestic account gives a total supply of 1,533,600,000 pounds of new and old copper available for domestic consumption in 1938. The secondary copper, however, includes remelted new scrap as well as old scrap. The new scrap represents a revolving supply required in manufacturing, so that a more significant figure of supply available for domestic consumption is obtained by adding to the new refined copper only the secondary copper derived from old scrap (534,600,000 pounds). The total available for consumption by this calculation would be 1,348,600,000 pounds in 1938 compared with 2,207,600,000 in 1937 and 2,587,000,000 in 1929.

*Industrial use of copper.*—The American Bureau of Metal Statistics estimates the actual consumption of new and old copper in the United States by uses. Data for the past 5 years are shown in the accompanying table.

| | 463,000 | 574,700 | 749,000 | 860,000 | 605,000 |

[1] Generators, motors, electric locomotives, switchboards, light bulbs, etc.
[2] Transmission and distribution wire and busbars; accounting only for the public-utility companies.
[3] Includes industrial wire and cable, wire in buildings, railway cars and ships, radio broadcasting, railway and municipal signaling, railway electrification, trolley wire, rod and wire for Government projects, blasting wire, flexible cord, and sundries.
[4] Does not include starter, generator, and ignition equipment.
[5] Excludes electrical work.
[6] Bearings, bushings, lubricators, valves, and fittings.
[7] Includes air conditioning.
[8] Excludes electrical equipment.
[9] Other than railway.
[10] Includes condenser tubes, oil-burner tubing, welding rod, screw-machine products, nickel-silver and phosphor bronze products, rivets and burrs, toilet pins, eyelets and grommets, electrotyping and engraving sheet, spark plugs, inner-tube valve stems, jar tops and rouge boxes, flashlight tubes, kerosene lamps, kitchen utensils, kitchen-range boilers, linotype matrices, safety razors, blasting caps, asbestos textiles, water meters, thermostats, soldering coppers, yacht fittings, coinage, washing machines, household water heaters, fire extinguishers, etc., all reckoned in terms of copper content.

The foregoing table shows that the use of copper in automobiles in 1938 declined more sharply in relation to 1937 than any other important use for copper; it was 51 percent below 1937 and 60 percent below 1929. The total copper used fell 30 percent from 1937, according to these figures, and was 48 percent lower than in 1929. Although copper used in telephone and telegraph equipment dropped proportionately less than the total for 1938, consumption for this purpose made the poorest showing in relation to 1929, having fallen 82 percent below that year. Light and power lines declined 25 percent in 1938, and other rod and wire fell 41 percent. Government stimulation of the building industry must have been partly responsible for the fact that consumption of copper by this industry held up better than in any other, being only 4 percent below 1937 and 14 percent above 1929.

## STOCKS

The following table gives domestic stocks of copper as reported by primary smelting and refining plants. Stocks of blister copper in transit from smelters to refineries are included under blister copper.

*Stocks of copper in the United States, Jan. 1, 1935–39, in pounds*

| Year | Refined copper | Blister and materials in process of refining | Year | Refined copper | Blister and materials in process of refining |
|---|---|---|---|---|---|
| 1935 | 569,000,000 | 389,000,000 | 1938 | 358,000,000 | 428,000,000 |
| 1936 | 350,000,000 | 472,000,000 | 1939 | 362,000,000 | 466,000,000 |
| 1937 | 220,000,000 | 391,000,000 | | | |

Digitized by Google

Stocks of refined copper at refineries were 1 percent higher at the end of 1938 than at the end of 1937; those of blister and unrefined copper at smelters, in transit to refineries, and at refineries were 9 percent higher; and total refined and unrefined stocks increased 5 percent.

Figures of the Copper Institute, quoted in the press, indicated that world stocks aggregated 457,168 short tons at the end of 1938, a 3-percent decrease from the beginning of the year. This decline was due to smaller stocks in foreign countries, where inventories fell from 211,844 to 167,413 tons (21 percent), for stocks of refined, duty-free copper in the United States increased from 259,351 to 289,755 tons (12 percent). These figures do not show the extensive changes during the year. In the United States the excess of production over low domestic requirements in the first 5 months of the year resulted in stocks increasing 43 percent by the end of May. Improved demand and reduced domestic output caused a drop of more than 100,000 tons in inventories by the end of October; then stocks increased. Refined stocks abroad fell from 211,844 tons at the end of 1937 to 155,049 tons at the end of November 1938. They increased 12,364 tons to reach 167,413 at the end of December. According to the Copper Institute, blister stocks gained 5,861 tons in the United States but declined 4,218 tons abroad in 1938. Copper Institute figures for the United States presumably include some metal held by consumers or at some secondary plants, as reports to the Bureau of Mines from primary refineries indicate that stocks of refined copper at refineries, as shown in the foregoing table, were 181,000 tons at the end of 1938 and 179,000 tons at the end of 1937 (compared with 289,755 and 259,351 tons).

Data for consumers' stocks are not available.

## PRICES

Reports to the Bureau of Mines from copper-selling agencies indicate that 615,000 short tons of copper were delivered to domestic and foreign purchasers in 1938 at an average price (f. o. b. refinery) of 9.8 cents a pound compared with 12.1 cents in 1937 and 9.2 in 1936.

The producers' quotation for copper delivered at Connecticut points was 10.12½ cents at the beginning of 1938. It rose ¾ cent in the early part of January, fell ⅞ cent in the latter part of the month, and declined 1 cent more to 9 cents in May, the lowest price for the year. During the first 5 months of the year demand in the United States was at a very low level, and producers' sales to domestic customers totaled only 22,600 tons or about half the monthly average for all of 1937. During these months domestic output was well ahead of domestic consumption and exports, and large additions to inventories were being made. Announcements in May and June of important reductions in operating rates at domestic mines (already made or to be made), in complete summer shut-downs for some properties, and in a reduction of 10 percent in the rate for the cartel group, resulted in easing of the selling pressure. On June 30 sales of copper totaled 30,954 tons and in the week of June 27–July 2, 118,660 tons, or more than the 112,889 tons sold during the first 5 months of the year. Apparent domestic consumption advanced from May until the high point of the year was reached in October, and stocks of refined copper declined more than 100,000 tons during that period. The price was

raised 1⅛ cents a pound in July, ¼ cent in September, and ⅞ cent in October to 11.25 cents, the highest quotation for the year. Consumption abroad was at high levels throughout the year, and refined stocks were reduced every month (with one exception) from January through November. War fears are believed to have been largely responsible for the relative scarcity of spot metal abroad in October. The cartel moved quickly in announcing increased production rates in October, in an evident effort to prevent a run-away market, and market tension eased. By October domestic production more than doubled the lowest monthly rate—that for July. Demand declined after October, but production continued to increase and producers' sales to domestic consumers fell to 10,800 tons in November and 15,100 tons in December, the lowest monthly sales reported for the entire year. During the last 2 months of the year domestic refined stocks increased, and in December foreign stocks rose sharply.

For a large part of the year selling conditions abroad were more favorable than in the United States, and exports of domestic copper were maintained at a relatively steady rate throughout the year; in all, they were higher than in any year since 1928. November and December producers' prices were maintained at 11.25 cents a pound in the face of very light sales.

Most of the copper disposed of during November and December was sold on the Commodity Exchange, at discounts of as much as 1–1.25 cents a pound. The importance of this facility for dealing in Standard copper has increased greatly in recent years. Before it was established London was the only large market where copper could be freely traded in, but in recent years activity on the New York Commodity Exchange has permitted the American industry to conduct its hedging operations at home. Sales of Standard copper on the Commodity Exchange were approximately 25 percent of those on the London Metal Exchange in 1936, 50 percent in 1937, and 75 percent in 1938.

## FOREIGN TRADE [2]

United States imports and exports of copper constitute a well-balanced trade through which the smelting, refining, and manufacturing facilities of this country are utilized to treat foreign raw materials and to return refined copper and manufactures of copper abroad. Ninety-nine percent by weight of the copper imported in 1938 was contained in ore, concentrates, and unrefined furnace products. Most of the remainder consisted of ingots to be remelted and recast in the United States. By contrast, 95 percent of the exports comprised refined copper and primary manufactures therefrom.

The United States has long had an exportable surplus of copper and exported more copper than it imported for many years. In 1930–32 imports exceeded exports, and a tariff of 4 cents a pound was placed on copper in 1932. Exports have exceeded imports since that time, and the principal part of imports has been for smelting, refining, and export.

Separation of total exports to show the quantity of domestic copper shipped from the United States is not possible. Data at hand, however, indicate that exports of domestic copper rose sharply in 1938, owing to frequent periods during the year when selling conditions abroad were better than in this country. Excess of total exports over imports of unmanufactured copper rose from 141,000,000 pounds in 1937 to 340,000,000 pounds in 1938. In addition to the copper shown in the accompanying tables an unrecorded quantity of metal is exported in manufactures, such as electrical machinery, automobiles, and similar equipment.

*Imports.*—Imports of all classes of unmanufactured copper except concentrates declined in 1938, the total being 10 percent below 1937. Imports of ore from Chile, Cyprus, and Mexico were sharply lower in 1938 than in 1937. Receipts of copper in concentrates gained in 1938 because of increased quantities from Mexico, Canada, and Cuba, for those from other important sources declined. More unrefined copper was received from Canada and Turkey in 1938 than in 1937, but the decline in imports from Chile, Mexico, and Yugoslavia more than offset the increase from those countries. Imports of refined copper from Chile dropped sharply in 1938.

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

| 1934 | 426,571,568 | 1937 | 559,749,133 |
| 1935 | 514,364,526 | 1938 | 504,327,779 |
| 1936 | 380,677,700 | | |

[1] Data include copper imported for immediate consumption plus material entering the country under bond.

*Exports.*—Exports of all classes of copper totaled 844,027,426 pounds in 1938, an increase of 20 percent over 1937, and were the largest since 1929; they amounted to 80 percent of the average for 1925–29. The gain in total shipments of copper abroad is explained mainly by the largely increased exports of refined copper (the principal class of exports) to countries that were either at war or anticipating war—Germany, Japan, Czechoslovakia, and Poland—for exports to other large customers, such as the United Kingdom and France, dropped. Germany received the principal part of the old and scrap copper exported, about the same quantity as in 1937, while Japan's imports of this class fell sharply.

## SMELTING AND REFINING

One of the present-day trends in reverberatory smelting is definitely toward high-tonnage operations, according to Honeyman.[3] At the Phelps Dodge Corporation Douglas (Ariz.) plant, the reconstructed 107- by 26-foot reverberatory furnaces are operated at the rate of 1,000 tons of solid charge a day. The arch, all of silica brick, is high enough above the bath to give ample combustion space within the furnace.

[3] Honeyman, P. D. I., Metallurgy of Copper: Min. and Met., vol. 20, No. 385, January 1939, p. 19.

Digitized by Google

At Noranda high tonnages—up to 1,500 tons of solid charge per furnace day—were reported smelted in reverberatories. Use of the suspended magnesite arch continues at this plant. At both the Douglas and United Verde smelters of Phelps Dodge extensive use is being made of C. R. Kuzell's method of hot-patching the inside of silica arches of reverberatories without interfering with furnace operation. The method consists of building up and renewing worn areas in the refractory surfaces by spraying on an aqueous suspension of finely divided particles of refractory material.

The design of the new Nevada Consolidated Copper Corporation smelter at Hurley, N. Mex., is much like that for the company's revamped smelter at McGill, Nev. At McGill the reverberatory is of the wet-charge type, the charge material being distributed along the furnace by vibrating conveyors. Use of the wet charge makes possible virtual elimination of dust, and this practice will be used at Hurley.

According to Boggs,[4] Tennessee Copper Co.'s principal source of revenue is from sulfuric acid and iron; consequently, its copper metallurgy is passing through a slow process of change from the old method of smelting ore directly in blast furnaces to all-milling selective flotation. When the article was written only one small blast furnace was in operation. Boggs said that it was to be replaced in the near future, probably with a coal-fired reverberatory or an electric furnace.

New developments in connection with electric smelting include improved practice in building large electric furnaces of a size more nearly comparable with that of reverberatories. According to Sem,[5] the new methods that have been developed lately for utilization of sulfur dioxide in smelter gases have made it desirable—in many instances necessary—to utilize the gases. The economic possibility, however, depends to a great extent on concentration of sulfur dioxide in the gases. He claims that a high concentration in gas is possible only in an electric smelting furnace where the gas is not diluted with gases of combustion.

Several articles on copper refining, published recently, are of general interest.[6]

## WORLD ASPECTS OF COPPER INDUSTRY

*International cooperation.*—During 1938 the flexibility of the copper-restriction scheme was proved. As the year began, foreign producers who are members of the cartel were operating at 105 percent of their agreed production capacities. These capacities, incidentally, do not represent actual production capacities but are merely bases for the regulation of operating rates. Foreign demand was well maintained throughout the year, and foreign visible refined stocks declined almost steadily, but the reverse of these conditions prevailed in the domestic market. The unsatisfactory situation in the United States and the large exportation of United States copper contributed to the midyear weakness in European price. The cartel took steps to protect the position of the foreign market by reducing output 10 percent,

Digitized by Google

or to 95 percent of agreed capacities, effective July 1. Smaller domestic and foreign production and increased consumption marked the third quarter of the year, and by October a tight situation developed regarding foreign supplies, partly or largely caused by war fears. In an evident effort to prevent a run-away market, the foreign group in October, announced two step-ups in production rates—to 105 percent of capacity and to unrestricted production. The largely increased tonnages made available, combined with a reversal of the uptrend of consumption, caused the cartel members to announce resumption of production restriction to 110 percent of capacity, effective January 1, 1939. Before this rate was obtained, it was deemed advisable to cut the output rate to 105 percent for December 15 to 31 and to 100 percent at the beginning of 1939. The rapid changes in cartel rates of activity in the last quarter of 1938 would seem to indicate that the group is more interested than formerly in short-time trends.

The following table, published in the annual review of Brandeis, Goldschmidt & Co., Ltd., for 1938, shows clearly the spread between capacities agreed upon for calculating production quotas and estimated full capacities.

*Calculated basic production capacities, highest monthly outputs, and estimated full capacities of the chief properties operating under the restriction scheme, in long tons*

| Producer | Agreed capacity at 100 percent | Highest monthly output | Estimated full capacity |
|---|---|---|---|
| Chile Copper Co | 145,000 | 19,000 | 220,000 |
| Andes Copper Co | 30,000 | 7,000 | 100,000 |
| Braden Copper Co | 117,000 | 13,000 | 160,000 |
| Rhodesian producers | 202,000 | 19,000 | 280,000 |
| Katanga | 112,000 | 17,000 | 200,000 |
| | 606,000 | 75,000 | 960,000 |

*World production.*—Mining and smelting of copper in the world are concentrated in the United States, Chile, Canada, Northern Rhodesia, Belgian Congo, U. S. S. R., and Japan. The United States predominates in copper refining by a much wider margin and is followed in importance by Chile, Germany, Canada, Great Britain, and Belgium.

World smelter production of copper fell 14 percent below the high record of 1937 but, except for that year, was the highest ever attained. As the output from domestic materials at plants in the United States was about one-third below 1937, the high level of world production in 1938 is explained by nearly record operations abroad. Of the important copper-producing countries Canada and Northern Rhodesia produced more copper than ever before; but output in Northern Rhodesia, at least, lagged considerably behind capacity operations. Chile's smelter production decreased 15 percent, but mine output only 10 percent. Belgian Congo's smelter total was 18 percent below 1937. The below-capacity production in Northern Rhodesia and the drop in Chile and Belgian Congo were due to restricted activity agreed on by cartel members. The strenuous efforts of countries like Germany, U. S. S. R., and Japan to become more nearly self-sufficient in supplies of copper made little headway in 1938. Output in U. S. S. R. increased; eventually this country will supply all of its own needs and have an exportable surplus of metal, but its program lags behind Government plans, and a large import balance continues.

[1] Copper content of blister produced.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. The production from domestic ores only, exclusive of scrap, was as follows: 1936, 554,659 tons; 1937, 757,188 tons; 1938, 510,133 tons.
[3] Copper content of exports.
[4] Figures represent blister copper only. In addition to blister copper, Belgium reports a large output of refined copper which is not included above as it is believed produced principally from crude copper from the Belgian Congo and would therefore duplicate output reported under the latter country.
[5] Data not yet available. [6] Approximate production. [7] Exclusive of material from scrap.
[8] Smelter output from ores. [9] Output from U. S. S. R. in Asia included under U. S. S. R. in Europe.
[10] Smelter product. [11] Exports of ingots and slabs. [12] Less than 1 ton.
[13] Approximate production, based on the output of the countries shown, which in 1937 contributed about 90 percent of the total world output.

Digitized by Google

*World consumption.*—World consumption of copper in 1938 declined 10 percent from the high record established in 1937; it exceeded that in any other year except 1937, however, according to figures of the American Bureau of Metal Statistics. The lower total may be ascribed to the 41-percent drop in United States consumption, because the use of copper abroad reached a new high level in 1938. By an examination of world consumption figures it is almost possible to ascertain the countries where disturbed political conditions existed or where war was either under way or anticipated. These data show that apparent consumption rose 42 percent in Austria, 48 percent in Germany, 51 percent in Poland, and 10 percent in Japan over totals for 1937. The consumption figures for these countries are more impressive if compared with 1934, showing gains of 178, 53, 142, and 78 percent, respectively. In comparison with 1934 consumption in U. S. S. R. increased 197 percent and in Czechoslovakia 79 percent, although they gained only 5 percent each in 1938. It is interesting to note that consumption rates in France and the United Kingdom declined 9 and 15 percent, respectively, from 1937 but increased 20 and 17 percent over 1934. Consumption in the United Kingdom, however, was at record-breaking levels in 1937. All foregoing figures are undoubtedly exaggerated for any one year. Surely Germany and Japan cannot have consumed all of the metal made available by production and importation in recent years. Possibly the statistics can be taken to indicate that the United Kingdom acquired a more nearly adequate stock pile of metal in advance of Germany and Japan and that much of the copper credited as consumption in those two countries in 1937 and 1938 went into inventories.

## REVIEW BY COUNTRIES

*Belgian Congo.*—Production of copper in Belgian Congo amounted to about 124,000 metric tons in 1938 compared with 150,588 tons in 1937.

According to an item in the South African Mining and Engineering Journal of December 31, 1938, Prof. Maurice Robert, director of the Geological Service of the Katanga Special Committee, in a report to the Belgian Colonial Institute (Brussels) anticipated that important mining discoveries could still be made and that these discoveries will be made mostly underground. They certainly will be more difficult to work and may have an inferior yield, but their probable existence should extend the life of Katanga as a mining country far longer than is expected at present. Late in 1938 employees at Union Minière du Haut Katanga were estimated to total nearly 1,000 Europeans and about 13,000 natives.

Press reports indicate that copper discoveries in depth by Union Minière in the west are so considerable that they are likely to occupy the main part of company activities in the future and to necessitate transfer of its major operations from Kipushi-Elisabethville-Jadotville to the Kolwezi, where a concentration plant will be erected.

*Canada.*—Production of copper in Canada continued to establish new records in 1938, with a mine total of 293,010 short tons compared with 265,014 in 1937. Smelter production also reached a new high rate, totaling 245,519 tons compared with 231,513 in 1937. Of the

Digitized by Google

total mine production 55 percent came from Ontario where the output is entirely from the nickel-copper ores of the Sudbury district. The International Nickel Co. of Canada, Ltd., is the principal producer in this district, whose production of copper is determined by the output of nickel. Operations at the refinery were uniform throughout the year and substantially at present capacity. The Copper Cliff smelter produced 182,904 tons of bessemer matte and 158,912 tons of converter copper. The Ontario Refining Co. Ltd., subsidiary of International Nickel, received 158,793 tons of converter copper in the molten state from the Copper Cliff smelter and produced 145,141 tons of refined copper. Quebec supplied 19 percent of the total, with production principally from Noranda Mines, Ltd. Noranda blister is shipped to the Canadian Copper Refiners, Ltd., at Montreal East. The outstanding achievement of the year was reported to be the discovery at considerable depth of a new ore body in the Amulet section of Waite-Amulet Mines, Ltd., controlled by Noranda, and plans are being made for its development. Noranda smelts the product of Waite-Amulet and Normetal, but Aldermac exports its concentrates. The Consolidated Copper & Sulphur Co., Ltd., operated continuously and exported copper and pyrites concentrates.

The Flin Flon and Sherritt Gordon mines produced the output accredited to Manitoba and Saskatchewan. These mines ship their ores to the Hudson Bay Mining & Smelting Co., Ltd., for smelting. Output in Manitoba increased from 22,460 tons in 1937 to 32,791 in 1938 while that in Saskatchewan dropped from 11,218 to 9,078 tons.

British Columbia production increased from 22,899 short tons in 1937 to 32,571 in 1938 because the mine of Granby Consolidated, reopened in May 1937, produced steadily throughout 1938. The Britannia mine on Howe Sound produced at about the same rate as in 1937. Granby's entire production is being shipped to Japan, and Japanese interests are reported also to have reopened the old Tidewater copper mine on the west coast of Vancouver Island. Copper mining at Britannia Beach was described by Huttl.[7]

The following table shows the production of copper, by Provinces.

*Copper produced (mine output) in Canada, 1937–38, by Provinces, in pounds*

| Province | 1937 | 1938 | Province | 1937 | 1938 |
|---|---|---|---|---|---|
| British Columbia | 45,797,988 | 65,141,290 | Quebec | 94,653,132 | 112,645,797 |
| Manitoba | 44,920,835 | 65,582,772 | Saskatchewan | 22,436,843 | 18,156,157 |
| Nova Scotia | 180,609 | | | 530,028,615 | 586,020,402 |
| Ontario | 322,039,208 | 324,494,386 | | | |

Canada exports most of its copper and in 1938 shipped 54,903 tons of copper in ore, matte, regulus, etc.; 15,264 tons of blister; 181,764 tons of ingots, bars, etc.; 26,756 tons of rods, strips, etc.; and 1,719 tons of old and scrap copper to foreign countries. Of the ore exported 29,257 tons went to the United States and 15,168 tons to Japan. The United Kingdom was the destination of 108,263 tons of the refined ingots and bars exported.

*Chile.*—In 1938 production of copper in Chile amounted to 337,508 metric tons, a decline of 15 percent from the record output of 1937 yet with the exception of that year the highest on record. Mine production totaled 371,370 tons compared with 413,010 in 1937. Copper is a very important source of revenue to the Government of Chile, and plans were being formulated early in 1939 for obtaining additional funds from this industry. A proposal approved by the Chamber of Deputies included a progressive tax on exports—exempting copper below 6 cents (American currency) a pound—of 10 percent on the difference between 6 and 10 cents, 20 percent on the difference between 6 cents and prices above 10 cents and as much as 15 cents, and 30 percent on the difference between 6 cents and amounts above 15 cents a pound. The Chilean Senate, on the contrary, approved a 10-percent tax on copper producers' profits as a substitute. No final decision had been reached by May 1939.

The Instituto de Fomento Minero è Industrial de Antofagasta announced on May 8, 1938, that it had been authorized by the Caja de Credito Minero to purchase low-grade copper ores at 230 Chilean pesos instead of 139, Caja's previous price. It is said the Caja will not realize any profit by paying this higher price but hopes to stimulate the small mining industry of Antofagasta and other Provinces of Northern Chile thereby. It will make available to small miners, at cost, explosives and other materials necessary to the mining of low-grade copper ores.

The Chile Copper Co. produced 148,100 metric tons of copper in 1938 compared with 181,800 in 1937, and Andes Copper 55,200 tons compared with 54,900. These two companies are subsidiaries of Anaconda Copper Mining Co. Braden Copper Co. (subsidiary of Kennecott Copper Corporation) produced 119,800 tons of copper, second only to the record output of 144,300 tons in 1937. During 1938, 7,075,042 short (6,418,337 metric) tons, assaying 2.22 percent copper, were treated. Improvements in metallurgy at the mill resulted in the production of concentrates that averaged 33.08 percent copper compared with about 26 percent before the concentrate grinding and re-treatment plant was placed in operation in 1937. A strike lasting 11 days occurred in July and was amicably settled. The history, geology, mining methods, and safety program of the Braden mine were discussed in an article published in 1938.[8]

Most of the copper produced in Chile is sold for consumption in other countries. Exports of electrolytic copper totaled 184,200 metric tons in 1938 compared with 186,060 in 1937. Of the 1938 total 75,621 tons were shipped to Great Britain, 48,449 to Belgium, 16,919 to Sweden, 16,535 to France, and 12,808 to Italy. Blister exports totaled 165,120 tons in 1938 compared with 197,189 tons in 1937. The United States was the principal destination of the exports of blister in 1938, 56,532 tons going to that country while 50,651 went to Great Britain, 17,786 to Switzerland, 16,105 to Italy, and 10,692 to France. Exports of ore and concentrates fell from 22,707 tons in 1937 to 6,088 in 1938.

*Cyprus.*—Production of copper in Cyprus has increased in recent years. Exports of concentrates totaled 146,550 long tons, estimated

[8] Boletin Minero de la Sociedad Nacional de Mineria, La Braden Copper Co.: Vol. 54, April 1938, pp. 309–315.

Digitized by Google

to contain 20 percent copper in 1938 compared with 111,506 tons in 1937 and 58,714 in 1936. Germany received 141,481 metric (139,000 long) tons from Cyprus in 1938 compared with 79,710 (78,500) in 1937.

*Czechoslovakia.*—Demand for copper in Czechoslovakia continued at record-breaking levels and established a new-high record in 1938. This condition was brought about by the disturbed relations with Germany and other neighboring countries, which resulted in Czechoslovakia's annexation by Germany in March 1939. Imports of refined copper and of copper cakes totaled 26,322 metric tons in the first 8 months of 1938 compared with 32,854 tons for the year 1937. Exports were 1,404 and 2,388 tons, respectively. It is reported that the Krompach Copper Works in Slovakia produced 1,000 metric tons of raw copper in 1938 and hoped to treble this production in 1939. An electrolytic refinery is being installed.

*Finland.*—A detailed account of the mining, milling, and smelting methods employed by the Outokumpu Copper Co. and other information on copper production in Finland are given in an article by the general manager published in Mining and Metallurgy for February 1938 and summarized in the Bulletin of the Imperial Institute (London) for April–June 1938. The company is reported to have decided to construct a copper refinery in Imatra and a copper rolling mill near Pori in Bjorneborg where power supplies soon will be available.

*Germany.*—Figures covering mine output of copper in Germany are not available. Those for smelter production in 1938 differed little from those for 1937, showing a small increase. Germany's efforts to become more nearly self-sufficient with regard to its needs for copper, by increasing domestic mining and by curtailing the use of copper wherever substitution could be practiced, failed to make noticeable progress in 1938, when imports of different classes of copper-bearing materials again gained substantially. Imports of copper ores, including cupreous pyrites, totaled 653,931 metric tons compared with 555,578 in 1937 and 482,471 in 1936. It is noteworthy that Cyprus supplied 141,481 tons of the total compared with 79,710 in 1937. Copper imported in ingots, bars, etc., totaled 272,400 tons, of which 76,500 tons were credited to Rhodesia, 62,330 to the United States, 40,007 to Chile, and 39,931 to Belgian Congo. Imports of this class amounted to 169,920 tons in 1937 and 127,549 in 1936. Copper-scrap imports totaled 27,308 tons in 1938 and 32,703 in 1937. Germany exported 5,625 tons of ore, 355 tons of bars, etc., 17,689 tons of rods, sheets, etc., and 4,523 tons of wire in 1938. So much copper has entered Germany in the past several years that it seems almost certain that a stock pile of significant proportions has been accumulated. According to an editorial in the American Metal Market of March 23, 1939, it probably aggregates 200,000 or more tons. Germany's apparent consumption of copper totaled 339,000 metric tons in 1938, 228,300 in 1937, and 185,300 in 1936. These data are calculated in the conventional way on the assumption that metal made available was consumed. Any accumulation of stocks would reduce these figures on consumption.

*Japan.*—Publication of official statistics for Japan was prohibited subsequent to July 31, 1937. Available data, however, indicate that the consumption of copper in this country in 1938 surpassed the high

159434—39——9

Digitized by Google

record for 1937. Exports of refined copper from the United States increased from 73,000 short (66,000 metric) tons in 1937 to 109,000 short (99,000 metric) tons in 1938. Exports of copper in ore, matte, etc., from Canada to Japan rose from 2,842 short (2,578 metric) tons in 1937 to 15,168 short (13,760 metric) in 1938. According to Brandeis Goldschmidt & Co., Ltd., Japan probably consumed 240,000 long (244,000 metric) tons in 1938 compared with their estimates of 190,000 long (193,000 metric) tons for 1937 and 125,000 long (127,000 metric) tons for 1936. Their estimate for 1938 was made on the assumption of an increase in mine production to 90,000 long (91,000 metric) tons, on a 30,000-ton increase in exports from the United States, and on anticipated increases in receipts of ores and other cupreous materials from Canada, South America, and the Far East. The quantity of stocks accumulated by the Government from the additional tonnages made available during the year cannot be surmised, but it is unreasonable to assume that Japan has used all of the copper acquired in 1937 and 1938. In the middle of 1938 industry was reported to be poorly supplied.

*Northern Rhodesia.*—Smelter output of copper in Northern Rhodesia established a new high record in 1938 with a total of 216,450 metric (213,000 long) tons compared with 211,513 (208,000) in 1937, the previous record year. Although production was a record-breaking rate in 1938 because of agreed restrictions thereon it remained considerably below actual capacity.

Roan Antelope Copper Mines, Ltd., hoisted 3,126,100 short (2,791,161 long) tons of ore during the fiscal year ended June 30, 1938, from which 75,253 long tons of blister copper were produced. In the year immediately preceding 2,880,300 short (2,571,700 long) tons of ore and 69,560 long tons of blister were produced. The average cost was £22.151 per long ton of blister in 1938 compared with £21.880 in 1937. Ore reserves were estimated to be 87,498,099 short tons of ore containing 3.43 percent copper compared with 91,769,128 tons at the end of June 1937. Substantial additions to reserves are expected to result with the opening of ground in the Roan Antelope Extension not included in the original ore-reserve calculation. The company estimated that about £750,000 further expenditure would be required in the fiscal year ending June 1939 to complete the Western extension program and various plant enlargements that will raise the monthly output capacity to 10,000 short tons of copper.

The Rhokana Corporation, Ltd., produced 44,247 long (49,557 short) tons of blister copper and 32,028 (35,871) tons of electrolytic copper, a total of 76,275 (85,428) tons, in the fiscal year ended June 30, 1938, which differed little from the total of 75,254 (84,284) tons for the year immediately preceding. The average cost of blister production was £22 7s. 5d. and of electrolytic copper £24 4s. 3d. As a result of new arrangements the production quota for Rhokana was increased 952 short tons of copper a month, subject to the same percentage increases and decreases as the previous basic quota of 6,338 short tons. In the Nkana section 1,964,900 short tons and in the Mindola section 836,600 short tons were hoisted. A total of 2,796,500 short tons were concentrated during the year compared with 2,651,200 short tons in the fiscal year ended June 30, 1937. The company sold 1,662,771 pounds of cobalt (in alloy and refined

Digitized by Google

products) during the year. It has erected a plant for differential flotation of copper and cobalt ores (designed to produce a rich cobalt concentrate) and added a third electric furnace to its cobalt plant. The Nkana copper refinery was described by Wheeler and Eagle.[9] The establishment is a modern furnace and electrolytic plant designed for refining blister copper high in bismuth. This article is briefed in the January (1939) issue of Engineering and Mining Journal. Ore reserves at the end of June 1938 were reported as follows: Nkana North Ore Body, 24,398,056 short tons containing 3.51 percent copper; Mindola Ore Body, 78,378,616 tons containing 3.54 percent; and Nkana South Ore Body, 15,181,000 tons containing 2.79 percent—a total of 117,957,672 tons averaging 3.44 percent copper. Rhokana owns a 32.303-percent interest in Mufulira Copper Mines, Ltd.

Production of copper by the Mufulira Copper Mines, Ltd., was greatly increased in the fiscal year ended June 30, 1938. Ore extracted totaled 1,598,886 short tons containing 4.53 percent copper, ore milled amounted to 1,585,000 short tons, and blister copper was 52,436 long (58,728 short) tons. In the fiscal year ended June 1937 the output of blister copper was 37,230 long (41,698 short) tons. The company's basic quota is 4,811 long (5,388 short) tons of copper a month. During major reverberatory-furnace and waste-heat-boiler repairs in May 5,475 short tons of concentrates were shipped to the Roan Antelope smelter, and 2,573 long (2,882 short) tons of blister copper were produced for Mufulira. Additions to the smelter, to insure uninterrupted operation, were begun and include among other things a second reverberatory furnace, a second 60,000-pound waste-heat boiler, extensions to the converter aisle in both directions, a third 13- by 30-foot converter, and a 13- by 30-foot holding furnace with a second casting machine. Ore reserves comprised 110,499,000 short tons of 4.38-percent copper at Mufulira, 25,000,000 tons of 3.46-percent copper at Chambishi, and 21,000,000 tons of 3.47-percent copper at Baluba, a total of 156,499,000 tons averaging 4.11 percent copper.

*Peru.*—In 1938 the Cerro de Pasco Copper Corporation produced 78,458,979 pounds (35,588 metric tons) of copper, 12,396,991 ounces of silver, 74,063 ounces of gold, 57,329,999 pounds of lead, and 21,379 short tons of zinc concentrates. Production of this company in 1937 amounted to 75,094,065 pounds (34,062 metric tons) of copper, 9,881,827 ounces of silver, 51,455 ounces of gold, 42,005,290 pounds of lead, and 22,946 short tons of zinc concentrates. The corporation is reported to be developing a copper prospect at Ayuricocha, Peru, where 400,000 tons of ore averaging 9 percent copper have been developed.

*Turkey.*—An article in the Engineering and Mining Journal[10] describes conditions regarding copper in Turkey as follows:

> To place the copper mines, which have long remained inactive, again in operation constitutes one of the basic objectives of the Government economic program. The systematic work undertaken should soon show results. In fact, the Ergani mine has already begun producing Standard copper in 1939. The annual production of the company will be 12,000 tons.
>
> Eti Bank has also taken the necessary steps to work the Mourgoul mine, in the Province of Artvin. Plans have been prepared and construction of the plant,

[9] Wheeler, A. E., and Eagle, H. Y., Nkana Copper Refinery of Rhokana Corporation, Ltd.: Trans. Electrochem. Soc., vol. 74, 1938, Preprint 19, 24 pp.

[10] Engineering and Mining Journal, Fifteen Years of Mining in the Turkish Republic: Vol. 140, No. 5, May 1939, p. 34.

Digitized by Google

which will be larger than that of the Ergani mine, has begun. The mine's annual capacity will be approximately 12,000 to 15,000 tons.

The Kuvarshan copper mine, in the Province of Artvin, has been in operation for 2 years. After the foreign company, which had been working it, suspended its activities due to the crisis, the Government decided to put it in operation. The Eti Bank, which took possession of it, immediately completed the plant, with the result that the Kuvarshan is now in the exports list. Its annual capacity is about 2,000 tons. In 6 months of 1938 it exported 799 tons, against 200 in the corresponding period of 1937. At this pace, the exportation of copper from the Kuvarshan mines is expected to increase rapidly.

*U. S. S. R.*—Smelter production of copper in the U. S. S. R. increased from 94,250 metric tons in 1937 to 114,552 in 1938 but still lagged far behind Government plans. These called for an output of 135,000 to 145,000 tons in 1937 and for a much larger tonnage in 1938, looking forward to self-sufficiency and an eventual large exportable surplus of copper. Imports of metal during the first 9 months of 1938, however, totaled 49,500 metric tons, the same monthly rate as in1937 and substantially above the monthly rates in earlier recent years. The copper industry in the U. S. S. R. is described in the Bulletin of the Imperial Institute [11] which states that copper reserves of the U. S. S. R. total over 17,000,000 tons of metal. It says furthermore that the most extensive deposits are in Kazakstan, the two main groups being the Kounrad ores near Karsakpai and the Balkhash ores near the northern shore of Lake Balkhash. The Urals also contain considerable deposits of copper ore, and there are other deposits in Uzbekistan, Bashkiria, Middle Volga, West Siberia, Transcaucasia, Leningrad Province, and the Kola Peninsula. The large increase in demand for copper in the U. S. S. R. is due to rearmament, electrification, and rapid industrial development, which have advanced at a greater rate than production, resulting in the large importation already noted. In recent years operations of the copper industry have been changing from small- to large-scale status. The article says:

> Construction of the new works seems to be proceeding very slowly, and some of the "giants" projected some years ago still exist only on paper. A big step toward increased production has been taken by the linking up of two of the main producing areas, the Karsakpai and Balkhash deposits, by rail with Karaganda.
>
> The more important new works, under construction or projected, are:
>
> (1) The Balkhash plant. Construction of this plant was begun in 1930, and although 300 million rubles have been spent on construction and equipment no copper has yet been produced. The first section of the plant is designed to produce 35,000 tons of black copper per annum, and the total eventual output is to be 100,000 tons per annum. It was planned to produce about 12,000 tons in 1937, but as recently as December 10 it was announced that the first section of the concentration plant was only then about to be put into operation.
>
> (2) The Jezkazgan plant at Karsakpai in Kazakstan. This plant, which will work on low-grade ores (metallic content about 1.6 percent), is designed to produce eventually 200,000 tons of black copper per annum. It will be three or four years, however, before production is even begun.
>
> (3) Sreduralmedstroi, the Mid-Ural copper plant. The first section of the concentration plant, treating 2,400 tons of ore a day, was completed early in 1937. The eventual capacity of the concentration plant is 14,000 tons of ore a day, and of the plant as a whole 50,000 tons of copper a year.
>
> (4) Bliava in the Middle Volga region. This plant was expected to start operations in 1937 and to produce up to 5,000 tons of copper in that year. So far as is known it is not yet completed. Its eventual output capacity is stated to be 35,000 tons. It is also proposed at this plant to produce sulphur by the Norwegian patented "Orkla" process.

[11] Imperial Institute (London), The Copper Industry of the U. S. S. R.: Bull., vol. 36, No. 1, January-March 1938, pp. 52-60.

Digitized by Google

(5) A nickel-copper plant under construction at Monchegorsk in the Kola Peninsula.

(6) A projected plant to produce 100,000 tons of copper a year on the Central Asian ore deposits near Tashkent.

It will thus be seen that, adding present production of copper to the scheduled output of works under construction or proposed to be constructed in the next few years, the Soviet Union is planning for an eventual output, say within the next ten years, of about 500,000 tons of copper per annum.

Electrolytic copper is produced at present at the Ural works of Pishmin and Kishtin, the former having a potential output capacity of 100,000 tons per annum.

Methods of reducing concentrating and smelting losses are being studied, as it admitted, apparently, that plant efficiency is not satisfactory. Russian Economic Notes [12] state that, of the amount scheduled for capital investment, funds assigned for nonferrous metals recovery will be used chiefly to complete three copper refineries (the Pribalkhash, Central Ural, and Bliava), two nickel combines, and two aluminum plants. The first section of the Balkhash plant, designed for an annual output of 50,000 tons of copper, was put into operation late in 1938. It is reported that this plant is to be enlarged so that it will have a capacity of 100,000 tons by 1942.

*Yugoslavia.*—Mine output of copper in Yugoslavia advanced from 42,300 metric tons in 1937 to 49,500 in 1938. The Mines de Bor, operated under French control, reported the production of 41,992 tons of copper in 1938 compared with 39,410 in 1937. An electrolytic refinery was completed and opened on July 2. At the end of the year production at this plant was reported to be at the rate of 1,000 tons a month. Exports of crude copper began to fall when the new refinery was assured. Imports into the United States of unrefined copper from Yugoslavia declined from 17,300 tons in 1936 to 14,600 in 1937 and 9,600 in 1938.

The lead industry in the United States was affected adversely in 1938 by the decline in industrial activity at home and the tendency toward overproduction in the foreign market. Domestic production of refined primary lead decreased 25 percent and domestic shipments 27 percent from 1937. Production from foreign ores and base bullion more than doubled. Imports of crude materials and exports of finished lead products also increased. During the first 5 months of 1938 production exceeded demand, and stocks rose steadily. However, in the second half of the year curtailment of domestic output and improvement in demand caused a sharp reduction in producers' stocks of refined metal to the lowest year-end inventory since 1930. Prices dropped from 4.75 cents per pound at New York on January 1 to a low of 4.00 cents in May and June, rose to 5.10 cents in September to November, and declined to 4.85 cents at the close of the year. The average was 4.74 cents compared with 6.01 cents in 1937. Domestic quotations exceeded London prices by 1.41 cents in 1938 and 0.86 cent in 1937. During the latter half of 1938 weakness in the London market retarded price improvement in the United States.

[1] This report deals primarily with the smelting, refining, and consuming phase of the industry. For full details of mining operations see separate reports issued for the various States.

[1] Data include lead imported for immediate consumption plus material entering the country under bond.
[2] Revised figures.

Figure 1 shows trends in the domestic lead industry since 1900.

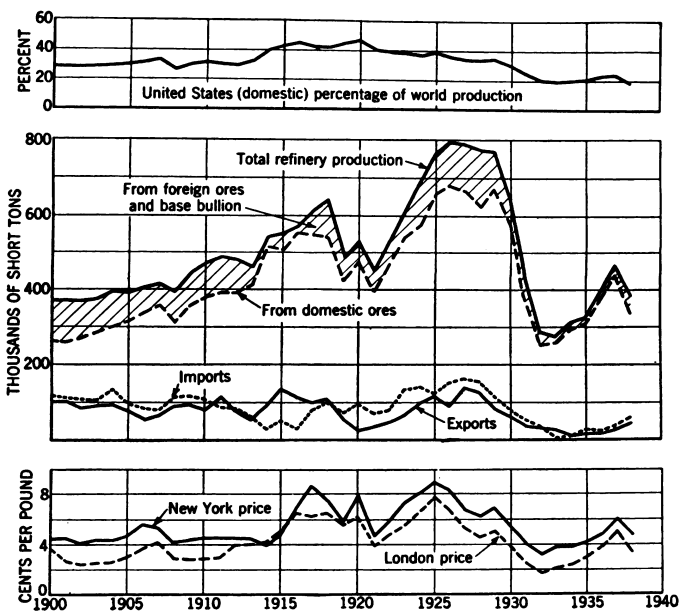

FIGURE 1.—Trends in the lead industry in the United States, 1900–1938. Imports include lead in ore, base bullion, pig lead, and scrap; exports include pigs, bars, and scrap and lead exported in manufactures with benefit of draw-back.

Digitized by Google

Outside the United States smelter production and consumption again attained new peaks and continued the steady increase that has persisted since 1932. Recovery abroad thus has far surpassed that in the United States. Foreign production in 1938 increased 12 percent compared with 1929, whereas that of the United States decreased 48 percent. Similarly foreign consumption increased 24 percent, whereas domestic demand declined 45 percent. All the more important foreign producers except Mexico, Belgium, and Tunisia increased their smelter outputs in 1938 over 1937. However, Mexico recorded a substantial rise in mine production. Apparent consumption in the United Kingdom, Germany, and Italy was higher in 1938 than in 1937, but that in France, Japan, Belgium, and U. S. S. R. was lower.

An event of unusual significance was the formation of the Lead Producers Association in September 1938. The organization includes most of the important producers outside the United States, and its announced purpose is to balance production with consumption. This action was prompted by the depressed prices on the London market, which reached extremely low levels in June. Effective November 1, 1938, a 10-percent reduction in output was agreed upon, with further curtailment if the market failed to improve.

*Trade agreements with the United Kingdom and Canada.*—As reported in Minerals Yearbook, 1938, the official announcements of the Secretary of State declared that the following lead products would be considered in negotiating a trade agreement with the United Kingdom: Litharge, red lead, suboxide of lead, lead-bearing ores, flue dusts, mattes of all kinds, and miscellaneous commodities. In the Canadian discussions lead ores, etc., as well as lead bullion or base bullion, lead in pigs and bars, lead dross, reclaimed lead, scrap lead, and alloys or combinations of lead "not specially provided for" were to be considered. At public hearings begun early in 1938 the lead industry filed briefs protesting any reductions in its protective tariffs. The final treaties were signed on November 17, 1938.

No concessions were made in either treaty on metallic lead or lead-bearing ores, scrap, etc. However, in the agreement with the United Kingdom the import duty on litharge was reduced, effective January 1, 1939, from 2.50 to 2.25 cents per pound, that on red lead from 2.75 to 2.25 cents per pound, and that on lead pigments "not specially provided for" (except suboxide of lead) from 30 percent ad valorem to 20 percent. Other reductions were made on bottle caps, collapsible tubes, and lead manufactures n. s. p. f.

The reciprocal-trade-treaty program thus far has reduced the import duty on several lead products, but no change has been made as yet in the lead industry's basic tariff protection on ores and metal. Zinc producers, however, have not fared so well. In the Canadian Trade Agreement the import duty on zinc ores and slab zinc was reduced 20 percent. An analysis of this cut is presented in the chapter on Zinc.

## DOMESTIC PRODUCTION

Refined pig lead produced in the United States is derived from three main sources—domestic ore, foreign ore and base bullion, and secondary materials. The following table lists the production from each of these sources from 1934 to 1938:

Digitized by Google

*Total pig lead produced in the United States, 1934–38, in short tons*

| Year | From domestic ores and base bullion | From foreign ores and base bullion | From secondary materials | Total |
|---|---|---|---|---|
| 1934 | 299,841 | 11,395 | 124,500 | 435,736 |
| 1935 | 310,505 | 14,055 | 156,800 | 481,360 |
| 1936 | 387,698 | 11,458 | 137,500 | 536,656 |
| 1937 | 443,142 | 24,175 | 154,500 | 621,817 |
| 1938 | 331,964 | 51,705 | 119,400 | 503,069 |

## PRIMARY LEAD

*Refinery production.*—Production of refined primary lead in 1938 decreased 18 percent and was only 49 percent of the 1925–29 average. Production from domestic ores decreased 25 percent in 1938, whereas that from foreign ores and base bullion increased 114 percent. Production from foreign materials was the largest since 1931 but represented only 51 percent of the 1929 output.

*Refined primary lead produced in the United States, 1934–38*

| Year | Production by— | | | | | | | Value | |
|---|---|---|---|---|---|---|---|---|---|
| | Classes (short tons) | | | | Sources (short tons) | | | | |
| | Desilverized lead [1] [2] | Soft lead [3] | | Total production [1] | From domestic ores and base bullion | From foreign ores | From foreign base bullion | Average per pound | Total |
| | | Desilverized | Undesilverized | | | | | | |
| 1934 | 186,468 | 22,744 | 102,024 | 311,236 | 299,841 | 10,241 | 1,154 | $0.037 | $23,031,000 |
| 1935 | 192,544 | 35,233 | 96,783 | 324,560 | 310,505 | 13,659 | 396 | .040 | 25,965,000 |
| 1936 | 239,944 | 47,462 | 111,750 | 399,156 | 387,698 | 11,401 | 57 | .046 | 36,722,000 |
| 1937 | 272,051 | 55,317 | 139,949 | 467,317 | 443,142 | 23,393 | 782 | .059 | 55,143,000 |
| 1938 | 243,891 | 31,986 | 107,792 | 383,669 | 331,964 | 32,862 | 18,843 | .046 | 35,298,000 |

[1] The lead content of antimonial lead is excluded.
[2] Desilverized soft lead is excluded.
[3] Includes lead derived from Missouri ores and other nonargentiferous ores.

*Source of primary lead.*—Of the total refined lead produced in 1938, 87 percent was derived from domestic ores and 13 percent from foreign ores and base bullion. Production from foreign ores increased 40 percent in 1938 and was the highest since 1930. Refining of foreign bullion was resumed on a large scale in 1938, chiefly because of the closing of one of the Mexican refineries during the latter part of the year, which diverted bullion to domestic plants. Details of the sources of lead from domestic ores are given in the section on Mine Production.

| Total foreign | 11,395 | 14,055 | 11,458 | 24,175 | 51,705 |
| Grand total | 311,236 | 324,560 | 399,156 | 467,317 | 383,669 |

*Antimonial lead.*—Antimonial or hard lead is an important by-product of the refining of base bullion, but the quantity derived from this source is only a small part of the country's yearly production. The major part is obtained from the smelting of antimonial-lead scrap, and some is produced by mixing metallic antimony with refined soft lead.

Several lead-smelting plants operate on scrap materials exclusively. Production data from such plants are summarized in the chapter in this volume on Secondary Metals—Nonferrous. A large quantity of hard lead scrap also is treated at primary smelters and refineries, and the production of antimonial lead at these plants is shown in the table that follows:

*Antimonial lead produced at primary lead refineries, 1934–38*

| Year | Production (short tons) | Antimony content | | Lead content by difference (short tons) | | | |
|---|---|---|---|---|---|---|---|
| | | Short tons | Percent | From domestic ore | From foreign ore | From scrap | Total |
| 1934 | 16,607 | 2,363 | 13.6 | 5,901 | 330 | 8,113 | 14,344 |
| 1935 | 16,384 | 1,729 | 10.6 | 4,685 | 491 | 9,479 | 14,655 |
| 1936 | 23,230 | 2,162 | 9.3 | 7,442 | 696 | 12,930 | 21,068 |
| 1937 | 27,524 | 2,579 | 9.4 | 7,833 | 1,721 | 15,391 | 24,945 |
| 1938 | 24,123 | 2,809 | 11.6 | 6,759 | 3,385 | 11,170 | 21,314 |

## SECONDARY LEAD

Recovery of secondary lead decreased 18 percent in 1938. Return of battery scrap for smelting and refining declined in 1938, and stocks at scrap-consuming plants were considerably higher at the end of the year than at the beginning. As the output of domestic refined primary lead dropped 25 percent, the ratio of secondary to primary lead

Digitized by Google

production increased from 62 to 68 percent. Additional details on production of secondary lead in 1938 are given in the chapter in this volume on Secondary Metals—Nonferrous.

*Secondary lead recovered in the United States, 1934–38*

[Compiled by J. P. Dunlop]

| Year | Pig lead (short tons) | | | Lead in alloys (short tons) | Total recovered lead | | |
|---|---|---|---|---|---|---|---|
| | At primary plants | At secondary plants | Total | | Short tons | Value | Ratio to domestic refined primary lead (percent) |
| 1934 | 33,557 | 90,943 | 124,500 | 83,900 | 208,400 | $15,421,600 | 70 |
| 1935 | 44,748 | 112,052 | 156,800 | 113,600 | 270,400 | 21,632,000 | 87 |
| 1936 | 34,556 | 102,944 | 137,500 | 125,400 | 262,900 | 24,186,800 | 68 |
| 1937 | 29,986 | 124,514 | 154,500 | 120,600 | 275,100 | 32,461,800 | 62 |
| 1938 | 24,800 | 94,600 | 119,400 | 105,500 | 224,900 | 20,690,800 | 68 |

## LEAD PIGMENTS

Lead pigments manufactured in 1938 contained 174,853 tons of lead, a decrease of 21 percent from 1937. Of this total, 162,828 tons were derived from refined pig lead; white lead comprised 46 percent, litharge 37 percent, red lead 16 percent, and sublimed lead and orange mineral 1 percent. Sublimed lead and leaded zinc oxide are the principal pigments in which the lead content is derived from ores.

*Lead in pigments,[1] 1934–38, by sources, in short tons*

| Year | Lead in pigments from— | | | | Year | Lead in pigments from— | | | |
|---|---|---|---|---|---|---|---|---|---|
| | Domestic ore [2] | Metal | Scrap | Total | | Domestic ore [2] | Metal | Scrap | Total |
| 1934 | 7,538 | 157,294 | 379 | 165,211 | 1937 | 17,363 | 204,961 | 127 | 222,451 |
| 1935 | 12,109 | 185,151 | 144 | 197,404 | 1938 | 12,025 | 162,828 | ------- | 174,853 |
| 1936 | 15,062 | 204,997 | 37 | 220,096 | | | | | |

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] No pigments from foreign ore.

## MINE PRODUCTION

Production of lead from domestic mines in 1938 decreased 21 percent from 1937, returning to the 1936 level. All three major producing regions shared the lower rate, with percentage declines as follows: Southeastern Missouri 22 percent, Coeur d'Alene 15, and Utah 27. Output in the Bingham district fell only 9 percent, but that in the Joplin region was 22 percent lower than in 1937. The closing of the Silver King Coalition and Park Utah Consolidated mines early in 1938 was mainly responsible for the fall in output of the Park City region which, in turn, was chiefly responsible for Utah's lower production. The Butte (Mont.) district produced only 204 tons of lead in 1938 compared with 5,780 tons in 1937 and more than 10,000 tons each in 1936 and 1935. Output in the Warm Springs (Idaho), San Juan Mountains (Colo.), and Metaline (Wash.) districts reversed the general downward trend and increased 84, 18, and 52 percent, respectively. Further details of production by mines, districts, and States can be found in the various State reports.

## STOCKS

Lead stocks, as reported by the American Bureau of Metal Statistics, are shown in the following table. Stocks of refined and antimonial lead include metal held by all primary refiners and by most refiners of secondary material who produce common lead. Foreign lead refined in the United States and entered for domestic consumption is included.

*Lead stocks at end of year at smelters and refineries in the United States, 1934–38, in short tons*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Refined pig lead | 223,593 | 215,595 | 165,159 | 119,837 | 102,489 |
| Antimonial lead | 10,437 | 6,711 | 6,697 | 9,294 | 13,413 |
| | 234,030 | 222,306 | 171,856 | 129,131 | 115,902 |
| Lead in base bullion: | | | | | |
| At smelters and refineries | 6,045 | 15,072 | 9,187 | 10,959 | 18,693 |
| In transit to refineries | 1,528 | 1,860 | 1,070 | 2,219 | 2,339 |
| In process at refineries | 11,567 | 16,233 | 14,100 | 14,413 | 16,690 |
| | 19,140 | 33,165 | 24,357 | 27,591 | 37,722 |
| Lead in ore and matte and in process at smelters | 60,699 | 58,562 | 50,098 | 52,081 | 56,332 |
| | 313,869 | 314,033 | 246,311 | 208,803 | 209,956 |

The upward trend in stocks evident in the last quarter of 1937 continued in the first half of 1938, as production continued to exceed shipments to consumers. During the latter half of the year the trend was reversed following improvement in demand and curtailment of production. Inventories of refined and antimonial lead at refineries reached a peak of 164,600 tons at the end of May, declined to 115,100 tons on December 1, and rose slightly during the last month of the year. The year-end stock of refined and antimonial lead was the lowest since 1930. The decline in the quantity of refined products on hand was offset partly by increases in stocks of base bullion and ore and matte in process.

Published data on the status of foreign lead stocks are not available, but the weak London market during 1938 and the organization of a producer's cartel to balance production and consumption suggests that large stocks of metal are held abroad.

## DOMESTIC CONSUMPTION

*New supply.*—The following table shows the refined primary lead available for consumption from 1934 to 1938, inclusive. The figures do not take into account variations in producers' stocks, and as these have changed considerably during the past 5 years the quantities stated do not indicate the true trend in the actual consumption of new lead. The supply available for consumption in 1938 was 24 percent less than in 1937 and was equivalent to only 49 percent of the 1925–29 average. The total consumption of lead, as indicated by the second table following, fell only 20 percent.

| Withdrawn: | | | | | |
| Exports [2] | 5,909 | 6,982 | 18,313 | 20,091 | [3] 45,866 |
| Supply available for consumption | 305,610 | 318,900 | 383,433 | [4] 449,464 | 339,708 |

[1] Includes small quantities of old, reclaimed, and scrap lead.
[2] Includes small quantities of foreign lead reexported.
[3] Includes a small quantity, not separable, of "sheets."
[4] Revised figures.

*Consumption by uses.*—Owing to the return of large quantities of secondary lead in discarded and obsolete articles and from the lead-consuming industries, the total consumption of pig lead greatly exceeds the supply of new lead available. The following table gives the American Bureau of Metal Statistics estimate of the total consumption of lead by industries, 1934–38.

*Lead consumed in the United States,[1] 1934–38, in short tons*

| Purpose | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| White lead | 64,500 | 80,000 | 85,500 | 86,000 | 71,000 |
| Red lead and litharge | 42,000 | 47,500 | 54,000 | 57,000 | 43,000 |

[1] American Bureau of Metal Statistics. These estimates are for the total consumption of lead irrespective of whether its origin is primary or secondary. Antimonial lead is included.

Lead consumption in the United States in 1938 was 20 percent below 1937 and 44 percent below the record established in 1929. Storage batteries require more lead than any other industry, the quantity so used in 1938 representing 31 percent of the total. This industry fared better than most other important lead-consuming industries, both in relation to 1937 and 1929; the declines were 13 and 20 percent, respectively, from those 2 years. Although it is desirable to have large requirements of lead for the manufacture of storage batteries, lead withdrawn for this use returns quickly to the market in the form of scrap and there competes with primary metal. As one authority

Digitized by Google

stated, lead so used is more in the nature of a loan. The quantity of lead consumed in foil was 1 percent higher in 1938 than in 1937 but 45 percent lower than in 1929, while that used for red lead and litharge, exclusive of the quantities of these pigments consumed in storage batteries, was 25 percent below 1937 but 43 percent above 1929. As has been stated in recent chapters of this series, the principal difficulties of the lead industry from the standpoint of consumption are due to the failure of the utility industry to purchase its proportionate share of the total and the low requirements of the building industry. Quantities used by both of these industries rose in 1937, but they declined again in 1938 and represented only 27 and 38 percent, respectively, of the totals for 1929. White lead is a most important outlet for lead, not only because of the large tonnage involved but particularly because metal so consumed is dissipated. Early in 1939 the Lead Industries Association, with this in mind, announced a 3-year promotion campaign designed to increase the use of white-lead paint.

## PRICES

The two major markets for lead in the United States are New York and St. Louis; much of the lead produced in the United States is sold at prices based on quotations in these markets. The New York quotations are influenced to some extent by the lower prices usually prevailing on the London market, so that the New York price seldom exceeds the St. Louis price by as much as the freight differential, which normally is 0.35 cent a pound.

The New York quotation for common lead averaged 4.74 cents a pound in 1938, a decrease of 21 percent from 1937 but slightly above the 4.71 cents recorded for 1936. The price was 4.75 cents as the year began, following a decline from 6.50 cents in September 1937. It increased slightly in January but resumed its downward trend at the end of the month, reaching 4 cents at the end of May, the lowest quotation of the year. During this period shipments were continuously below production, and refinery stocks advanced from 90,742 tons at the end of September 1937 to 164,636 at the end of May 1938. A virtual balance between output and shipments was attained in June, and stocks declined from then until December. Heavy buying of lead took place in June and July, and the price advanced 0.75 cent in June to 4.75 cents and continued upward to 5.12½ cents in September. During July and August weakness in the London position deterred price improvement in New York. In September important foreign producers met and decided on a 10-percent reduction in output. This action improved sentiment abroad and reacted favorably on the New York market. Sales were at a high level in the last quarter except for about 4 weeks beginning the middle of November. Sales jumped following a reduction in price to 4.75 cents in December. They were 16,287 tons in 1 week, and the price was raised to 4.85 cents, at which level it closed the year.

[1] St. Louis: Metal Statistics, 1939, p. 423. Average daily quotations of soft Missouri lead, f. o. b. St. Louis (open market), as reported daily in the American Metal Market.
New York: American Metal Market, daily issues. Pig lead, New York (outside market), prompt shipment from West.
London: Metal Statistics, 1939, p. 427. Average price of foreign lead. Price per long ton, as published in Metal Statistics, converted to cents per pound at average exchange rate reported by the Federal Reserve Board.
[2] London quotations in pounds sterling per long ton, as follows: 1936, £17.6000; 1937, £23.3250; 1938, £15.2667.

The London quotation ranged from a high monthly average of 3.60 cents a pound (United States exchange basis) in January to a low of 3.09 cents in June. It advanced to 3.44 cents in October but declined to 3.15 cents in December. The differential between the selling prices in the New York and London markets was much higher in 1938 than in 1937. It was lowest in March (0.94 cent) and highest in August (1.77 cents). The difference in price averaged 1.41 cents for the year compared with 0.86 cent in 1937 and 0.80 cent in 1936.

## FOREIGN TRADE [2]

The foreign trade of the United States in lead consists largely of imports of ore and base bullion, which are smelted and refined in bond, and the export of this lead either as pig lead or in manufactured products. This trade reached a peak in 1927 but dwindled to very small proportions in 1933. Since then, however, there has been substantial improvement. Imports of lead in ore, base bullion, and refined and scrap lead totaled 161,389 tons in 1927, 7,654 tons in 1933, and 63,901 tons in 1938; exports of refined lead decreased from 125,267 tons in 1927 to 5,909 in 1934 and advanced to 45,866 tons in 1938. In the same years exports of lead in manufactures with benefit of draw-back were 12,004, 7,472 and 9,061 tons, respectively.

*Imports.*—Total imports of lead in ore and matte, including imports for immediate consumption and entries for warehouse, increased 33 percent in 1938 owing chiefly to larger shipments from Mexico, Australia, and Chile. Imports of base bullion from Mexico likewise

[2] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Digitized by Google

increased substantially, but the quantity of refined lead and scrap received from abroad declined. Most of the refined lead imported in 1938 came from Peru. Total imports of lead in all the above forms increased 57 percent over 1937.

*Total lead imported into the United States, 1934–38, by classes, in short tons* [1]

| Year | Lead in ore and matte | Lead in base bullion | Pigs, bars, sheets, and old | Total lead content |

| 1938 | 390 | 77 | 126,660 | 433 | 374 | 38,708 |

*Exports.*—Exports of pigs, bars, and old lead more than doubled in 1938 as a result of the increase in custom smelting and refining of foreign ores and base bullion. A large part of the increase was credited to Japan, which purchased over four times as much in 1938 as in 1937. During the past 3 years substantial tonnages have been shipped to Mexico. This lead was base bullion derived from Mexican ores and returned to Mexico for refining.

[2] Less than 1 ton.

## TECHNOLOGY

*Mining.*—Ore pillars in the Southeast Missouri district are being mined and replaced with concrete. Preliminary attempts on some of the smaller pillars have been successful, and plans are under way for mining larger blocks of ore left for roof support. One of the major problems involved is the determination of the load carried by the pillar in order that the volume of concrete used may be kept at a minimum compatible with safety. In this connection the Bureau of Mines method [3] of ascertaining rock pressures by measuring the velocity of sound is being investigated as a practical means of measuring the load on the pillars.

Probert [4] and Parks [5] have summarized progress in mining technique during 1938, and articles by Schmitt [6] and Behre [7] review recent developments in mining geology. Drilling practice in the Tri-State region has been described by Nicolson.[8]

*Milling.*—According to Engelmann, Minerec A is now being used in about 80 percent of the western lead-zinc mills, where it has partly or completely replaced xanthate in the lead circuits. The new sloping-side Fagergren flotation machine has found favor with lead-zinc operators.[9] Fahrenwald [10] reports substantial improvement in ore-dressing practice and equipment during 1938. A method of treating lead-zinc-fluorspar ores by flotation has been developed by the Bureau

of Mines.[11] The mill of the Hecla Mining Co. at Gem, Idaho, has been modernized and the capacity increased to 900 tons of ore per day.

*Smelting.*—According to Oldright,[12] advance in lead smelting during 1938 was confined to further development of previously established practice. The tendency toward adoption of wider sintering machines and efforts to increase the capacity of blast furnaces continued. Fleming [13] called attention to the fact that more than 500 tons of charge yielding a slag containing 20 percent zinc are now being treated daily in a standard-size blast furnace at Port Pirie. Formerly such tonnages were realized only when the zinc content was low. In refining lead the removal of bismuth always has been troublesome, particularly in producing corroding grades. The use of magnesium and potassium for this purpose has been proposed (United States Patent 2,133,327, October 18, 1938).

## WORLD ASPECTS OF LEAD INDUSTRY

*International cooperation.*—Unsatisfactory conditions in the lead industry during the latter part of 1938 culminated in a meeting of the principal foreign producers in London on September 6 at which the Lead Producers Association was formed. The official communique issued after the meeting gave few details but indicated that the object of the cartel was to restrict output to balance it more nearly with consumption and thus improve prices. According to press reports membership included producers in Australia, Burma, Yugoslavia, and Canada, as well as the American Smelting & Refining Co., which has extensive lead-mining interests in Mexico, Australia, and Newfoundland. This group represents 60 to 75 percent of the foreign lead production, and it is planned to invite other producers to participate in the scheme. Effective November 1 a 10-percent reduction in production was agreed upon with further curtailment to be declared if the market failed to improve. This was the first positive action taken to control the lead market since the International Association of Lead Producers collapsed in 1932 as a result of the imposition of an import duty on lead in the United Kingdom. However, world producers have cooperated in exchanging statistics for several years.

*World production.*—World smelter production of lead in 1938 fell 4 percent below the total for 1937 and was equivalent to 91 percent of the record output in 1929. The relatively good showing made in 1938 was due to the fact that output abroad was at the highest levels ever attained, slightly exceeding the previous record of 1937, although production in the United States declined 22 percent. The 10 principal producers and the percentage of the total output each contributed in 1938 were: United States 20, Australia 15, Mexico 13, Canada 11, Germany 11, Belgium 5, Burma 5, the U. S. S. R. 4, Italy 3, and France 3. Of the important lead-smelting countries, Australia showed an increase of 1 percent, Germany 6, Burma 3, the U. S. S. R. 13, Italy 11, and France 12. There was very little change in the Canadian rate of

activity, but output in the United States dropped 22 percent, that in Mexico 7 percent, and that in Belgium 9 percent. Of the smaller producers, Peru almost doubled its output, following a substantial increase in 1937, and Spain and Poland also registered notable gains. The British Empire produced about 508,000 metric tons of smelted lead in 1938, about the same quantity as in 1937. Since the 5-year period 1925–29, the Empire share of world output has advanced from 22 to 31 percent, whereas that of the United States has dropped from 42 to 20 percent. The share of the British Empire rose from 30 percent in 1937 to 31 percent in 1938, while that of the United States fell from 25 to 20 percent.

[2] Data not yet available. Estimate included in total.
[3] Approximate production.
[4] Exclusive of secondary material (Metallgesellschaft, Frankfort on the Main).
[5] Figures cover lead refined from domestic and foreign ore; refined lead produced from foreign base bullion not included.

*World consumption.*—The American Bureau of Metal Statistics reports world consumption of lead in 1938 as 1,634,600 metric tons, a decrease of 6 percent from the peak of 1937 but, except for 1937 and 1929, the highest ever registered. Record-breaking consumption abroad, where the total was 2 percent above the previous high in 1937, partly offset the drop of 26 percent in consumption in the United States. Compared with the estimated use of lead in 1929 consumption in the United States declined 45 percent, while that in the rest of the world increased 24 percent. In 1938 the United Kingdom consumed more lead than ever before and supplanted the United States

Digitized by Google

as the principal lead-consuming country of the world, using 24 percent of the total. The United States used 22, Germany 15, Japan 6, U. S. S. R. 6, France 5, Italy 3, and the Netherlands, Belgium, Australia, New Zealand, and Sweden, about 2 percent each.

## REVIEW BY COUNTRIES

*Australia.*—The small increase in smelter output in 1938 was due to the larger production of Mount Isa which rose from 38,460 long tons in 1937 to 41,512 in 1938. Output at Port Pirie was approximately 190,000 tons in both years.

At Broken Hill production of crude ore increased from 1,468,000 tons in 1937 to an estimated 1,545,000 tons in 1938. The New Broken Hill mine is expected to begin production in 1940. Enlargement of facilities at the adjoining property of Zinc Corporation, Ltd., which is to treat the ore from the North Broken Hill mine, continued during 1938. North Broken Hill, Ltd., began operation of its new 50,000-ton-per-month concentrator in April 1939. The Broken Hill Proprietary mine was closed owing to exhaustion in February 1939. During a life of over 50 years the mine had produced 1,445,000 tons of lead and 189,457,000 ounces of silver.

The Lake George mine began producing in January 1939 when its new 500-ton-per-day mill was started. The ore contains approximately 8 percent lead, 12 percent zinc, and 2.5 ounces of silver per ton. A second 500-ton unit is planned.

Exports of lead ore and concentrates totaled 36,000 tons in 1938 compared with 34,500 in 1937. Exports of base bullion and refined lead declined from 203,000 to 195,000 tons. The metal went chiefly to Europe; Japan's purchases declined from 5,300 to 1,100 tons.

*Belgium.*—Smelter production of lead, which fell 9 percent from the peak established in 1937, is based on foreign ore, imports of which fell from 133,000 metric tons in 1937 to 107,000 in 1938. There were sharp declines in receipts from Yugoslavia, Sweden, Peru, and Canada, but shipments from Argentina and Bolivia increased. Imports of pig lead totaled 28,000 tons (mostly from Mexico), a slight advance over 1937. Exports of pig lead dropped from 68,000 to 67,000 tons. Loss of markets in France and Germany was largely offset by improved sales to the Netherlands.

Production of lead ore near Kengere (Katanga, Belgian Congo) is being stepped up, and monthly shipments to the smelter at Hoboken, Belgium, are anticipated. Belgian imports from this source were 6,400 tons in 1938.

*Burma.*—The Burma Corporation, Ltd., produced 99,773 long tons of lead concentrates containing 65 percent lead and 42 ounces of silver per ton compared with 107,073 tons containing 66 percent lead and 45 ounces of silver in 1937. The output of refined lead, however, increased from 76,500 to 78,900 tons and that of antimonial lead from 1,150 to 1,200 tons. In 1938, 5,920,000 ounces of refined silver were recovered compared with 6,180,000 ounces in 1937.

*Canada.*—Mine production of lead increased from 206,000 to 209,500 short tons. British Columbia produced nearly 99 percent of the 1938 total and the Yukon Territory slightly over 1 percent. No production was reported from Quebec and Nova Scotia in 1938.

Digitized by Google

At the Sullivan mine in British Columbia the concentrator treated 2,273,000 tons of ore which contained 15.83 percent combined lead and zinc and 4.02 ounces of silver per ton compared with 2,220,000 tons in 1937 which contained 16.46 percent lead and zinc and 4.2 ounces of silver. The smelter produced 211,500 tons of bullion compared with 204,700 tons in 1937. Smelter recoveries surpassed previous records, but mill recoveries were 0.50 percent below 1937. Costs were reduced slightly. The refinery produced 201,400 tons of refined lead and 9,764,000 ounces of silver. Net profits for 1938 were $6,214,000 compared with $14,670,000 in 1937. The lead plants at Trail were described by Huttl.[14]

Exports of pig lead fell from 177,000 to 155,000 tons. Shipments to Japan decreased from 43,000 to 17,000 tons, whereas those to the United Kingdom increased from 115,000 to 120,000 tons. The lead content of ore exported in 1938 was only 3,600 tons.

*France.*—Consumption of lead in France in 1938 is estimated at 86,000 metric tons, a 20-percent decrease from 1937. Smelter production was 12 percent higher, and imports of lead ore advanced from 43,000 to 52,000 tons, larger tonnages having been received chiefly from Morocco and Yugoslavia. Imports of pig lead declined from 73,000 to 47,000 tons, as shipments from Tunisia, Belgium, and Mexico decreased. In 1938, as in 1937, there were virtually no imports from Spain. Approximately 11,000 tons of lead ore were exported in 1937 and 1938.

The subsidy to French and French Colonial metal mines, suspended in October 1936 when prices were high, was reinstituted in June but apparently did not benefit lead producers during 1938.

*Germany.*—A 6-percent rise in smelter output was accompanied by an 11-percent increase in imports of lead ore from 127,000 metric tons in 1937 to 141,000 in 1938. If an average lead content of 65 percent is assumed, imported ore furnished more than 50 percent of the smelter production in 1938. Yugoslavia supplied 27 percent of the 1938 ore imports, Newfoundland 22 percent, Bolivia and Peru 21 percent, Australia 10 percent, and other countries 20 percent. Apparent consumption of lead increased from 235,300 to 246,500 tons and imports of pig lead from 73,300 to 75,300 tons. Mexico supplied 42,600 tons of pig lead in 1938 and Peru 8,400 tons.

In annexing Austria and Czechoslovakia, Germany acquired some lead resources but increased its dependence on foreign sources of supply. Austria's mine output was approximately equal to its consumption, but Czechoslovakia has been a net importer of 10,000 to 15,000 tons of lead annually. Active development of Austria's lead deposits is indicated by the announcement that the Bleiberger Bergwerks union has been absorbed into the raw-materials organization of the Four Year Plan. Production of lead and zinc ores and metallic lead is to be increased, and a detailed investigation of the lead-zinc resources of Karinthia and the eastern Alpine regions will be undertaken.

*Italy.*—Further progress was made in increasing the domestic production of lead ores, which advanced from 59,000 metric tons in 1937 to an estimated 66,000 tons in 1938. Smelter output thus rose 11 percent, while imports of lead ore increased only slightly—from 13,500

[14] Huttl, John B., Producing Lead at Trail: Eng. and Min. Jour., vol. 139, No. 6, June 1938, pp. 34–38.

Digitized by Google

to 13,700 tons. Apparent consumption totaled 51,900 tons in 1938 compared with 50,400 tons in 1937, and imports of pig lead declined from 10,900 to 8,600 tons. The principal lead mines are in Sardinia, and efforts are being made to expand production there. Italy expects to be independent of foreign sources of lead by 1940. The deposits in the Arbus area in southwest Sardinia were described recently by Wright.[15]

*Japan.*—Because publication of statistics on the mineral industries has been discontinued, details of the lead industry in 1938 are not available. The American Bureau of Metal Statistics estimates consumption at 100,000 metric tons, a decrease of 20,000 tons from 1937. This sharp decline is substantiated by the reduction in exports to Japan from Canada and Australia.

Japan imports over 90 percent of its lead, and because of the shortage of foreign exchange and the need of lead for military purposes its use in many other outlets has been restricted. On March 23, 1938, the importation of lead was placed under Government license, and on July 15 regulations were promulgated restricting the consumption of lead and other metals.

A Japanese company has been formed to develop lead, zinc, and copper mines at Tienpaushan, Chientao Province, Manchuria.

*Mexico.*—Mine production of lead increased from 218,133 metric tons in 1937 to 282,369 in 1938—29 percent; smelter output decreased 7 percent. Production of refined lead at the two refineries at Monterrey declined from 222,057 to 202,411 tons; the Penoles plant supplied 30 percent of the 1938 output and the A. S. & R. plant 70 percent. The latter was closed from November 18, 1938, to March 22, 1939, because of a strike. In August 1938 a 12-percent export tax was imposed on the appraised value of goods exported. Presumably this action was designed to give the Government the benefits accruing to exporters from the decline in the exchange value of the peso. The official value assigned for lead for the purpose of computing the tax was 0.98 cent per pound from August 10 to November 20, when it was increased to 1.10 cents.[16] As these values were substantially below world prices, the actual tax was considerably below 12 percent of the actual value of the metal exported. There has been no further news regarding the proposed lead smelter to treat labor-cooperative ores, mentioned in Minerals Yearbook, 1938.

Constantly increasing taxes and demands of labor have created hardships for many companies operating in Mexico. This is illustrated vividly by the following remarks of the chairman of the San Francisco Mines of Mexico, Ltd., at the shareholders' meeting in February 1938.

> In short, the technical position at the mine continues to be satisfactory. In order to maintain this position, however, a very active development program must be carried out, and we hope that the Mexican Government and Mexican labor will in their own interests do all they can to assist us in this.
>
> This brings me to labor. Our new collective contract was signed on the 26th February, 1937, but was retrospective to the 5th November, 1936, so that for 11 months of the year we were paying the higher rates. With its signature we had hoped we should be allowed at least a short period in which to carry on our operations without labor interference. I am sorry to say that this has not been the

Digitized by Google

case. It is true that the collective contract has not been upset, but we have been continually subjected to demands from labor, strike threats, incipient sit-down strikes, ore thefts, interference in management, and a general lessening of efficiency and discipline throughout the organization. At this very moment there is a sit-down strike of 1 hour daily for some unspecified reason. The executives at the mine, who anyway have a full-time job looking after the technical work, have had to devote much of their time and a great deal of overtime to handling labor matters. Inefficient labor and harassed officials must have an effect on operations. Conditions are now such that the company cannot bear further burdens, and accordingly I speak with the utmost frankness.

As I said before, the mine is now virtually being run for the employees. One hears in Mexico of talk of expropriation, but in the case of mining I believe the Mexican Government realizes that the Government itself or the Sindicatos could not run the mine as efficiently as can a technical staff highly skilled at the job and with long experience of the mine. In other words, under its present highly skilled management the mine has its best chance of weathering this stormy period of low metal prices. But the Mexican Government and Mexican labor must surely realize that shareholders, management, and British financial interests will not be content to give their cooperation if the reward is inadequate. It is not sufficient that the reward should only be forthcoming when base metals are at peak prices.

It should be borne in mind that the burden placed upon us by increased wages, social legislation and Government, and labor interference with operations does not finish the story. Cost of supplies, import duties, railway freights, loading charges at port, metal productions tax, salaries, and, in fact, nearly everything which enters into our costs of production have been stepped up.

*Newfoundland.*—Approximately 459,000 short tons of lead-zinc ore were milled during 1938, which yielded 47,100 tons of lead concentrates containing 27,400 tons of lead and 487,000 ounces of silver; 41,400 tons of concentrate were produced in 1937 and 46,000 tons in 1936.

*Peru.*—Exports of lead ore declined from 24,600 metric tons in 1937 to 18,800 in 1938, whereas shipments of concentrates increased from 22,000 to 34,000 tons and of refined lead from 15,800 to 28,500 tons. The Cerro de Pasco Copper Corporation increased its lead output from 19,000 to 26,000 tons.

*Spain.*—Owing to the civil war little information as to activity at Spanish lead mines has been available. However, in May 1938 it was reported that the Renteria smelter, which treats the lead concentrates from the Reocin mine, Santander, was producing at the rate of 5,000 tons annually. The lead mines of Linares, Cartagena, Magarron, and Jaen were in Government territory and those at Penarroya, Malaga, Cordoba, and Reocin in Nationalist territory throughout most of 1938.

*United Kingdom.*—Consumption of pig lead, as estimated by the British Metal Corporation, Ltd., totaled 344,000 long tons in 1938 compared with 337,000 tons in 1937. Of the 1938 total, 58 percent was used in sheet and pipe, white lead, oxides, etc.; 27 percent in cable; 7 percent in batteries; and 8 percent for miscellaneous purposes. The use of lead in cable and batteries increased 18 and 14 percent, respectively, over 1937, whereas its use in the other two items declined. Stocks of lead in official warehouses increased from 7,000 tons on January 1 to 11,000 on December 31, 1938. Only 3 percent of the domestic requirements was supplied by local smelters. Imports of pig lead increased from 373,000 tons in 1937 to 407,000 in 1938; 88 percent of the 1938 total was obtained from Australia, Canada, and Burma and the remainder chiefly from Mexico. Mexican shipments

Digitized by Google

ropped from 44,500 to 41,500 tons. Reexports of pig lead decreased rom 37,000 to 25,000 tons, and exports of lead and lead manufactures ose slightly from 13,500 to 14,500 tons.

Despite the lower prices for lead in 1938, mine output was mainained at 38,100 tons of 78-percent concentrates compared with 9,100 tons in 1937. Some concentrate is exported to continental melters. Exploration of old lead mines in the vicinity of Eyam, )erbyshire, is under way.

*Yugoslavia.*—Exports of lead concentrates again increased, totaling 9,500 metric tons in 1938 compared with 84,400 tons in 1937; Belgium ook 70 percent of the 1938 shipments. Trepca Mines, Ltd., treated 55,892 tons of ore in the fiscal year ended September 30, 1938, com-)ared with 638,729 tons in the previous fiscal year. Production of ead concentrates (79 percent lead) increased from 70,500 to 73,000 ons. Mill recoveries of more than 97 percent are being obtained. n August 1938 the properties of the Kapaonik, Zletovo, and Novo Brdo companies were absorbed by Trepca Mines, Ltd. An agreement ias been made with the Government whereby Trepca, through a ubsidiary company, will build a lead smelter at Zvecan. Initial nnual capacity of the plant is to be 12,000 tons of metal, but it is xpected that by 1941 the entire lead output of the Trepca group ill be smelted in Yugoslavia.

The statistical record indicates that the zinc industry experienced an unsatisfactory year in 1938. Smelter production from domestic ores declined 21 percent compared with 1937, apparent consumption was a third less, producers' stocks at the end of the year nearly doubled, and the average price at St. Louis declined almost 2 cents per pound. During the first 6 months domestic shipments were 45 percent below the average rate for 1937. As production was not reduced proportionately, stocks soared and prices dropped. By the end of June producers' stocks exceeded the depression high established in 1930, and in May prices fell to the lowest level since April 1935. Beginning in May, however, business improved steadily; by November shipments more than doubled those for the low point reached in April, and there was a substantial decline in inventories. Prices also improved, but the advance was restricted by the unsettled market in London and falling sterling exchange rates. The St. Louis quotation for prime western zinc fell from 5.00 cents at the beginning of the year to 4.00 cents in May but rose to 5.05 cents about the middle of October where it stayed until November 21. Two price cuts during the latter part of November lowered the quotation to 4.50 cents, where it remained throughout December, in which month deliveries to consumers declined and stocks again increased. From April to November 15 the differential between New York and London prices increased from 1.50 to 2.42 cents per pound; at the close of the year the differential was 1.98 cents. Imports were much lower in 1938, having declined 81 percent from the peak established in 1937, when a threatened shortage of domestic metal due to temporary conditions prompted large purchases abroad.

[1] This report deals primarily with the smelting branch of the industry. Full details of zinc mining are given in the various State reports. Some zinc ore is used directly in the manufacture of zinc pigments. (See chapter on Lead and Zinc Pigments and Zinc Salts.)

The outstanding event of the year was the announcement of a 20-percent reduction in the tariff on zinc and zinc ores effective January 1, 1939. Under the Canadian Trade Agreement signed November 17 the new duty on slab zinc was fixed at 1.40 cents per pound, a reduction of 0.35 cent from the previous rate of 1.75 cents in effect since 1922. Owing to the surplus of foreign zinc in recent years, London prices have been depressed to such an extent that domestic producers frequently have been threatened with loss of domestic markets through importation. As the old tariff has been nearly 100 percent effective during this period, it follows that the reduction in duty will have to be absorbed by domestic producers if they are to maintain their position in the home market. According to trade authorities this was done on November 21, 1938, when domestic quotations were cut 0.30 cent per pound.

Figure 1 shows trends in the domestic zinc industry since 1900.

Outside the United States apparent consumption increased 3 percent to a new all-time record. Armament probably has accounted for a large part of the increase in foreign consumption of zinc in recent years. It is interesting to note that Germany, Japan, and the U. S. S. R. recorded further increases in 1938, whereas the United Kingdom and France scored decreases. Production abroad likewise continued its steady rise of the previous 5 years and established a new high record. Supply exceeded demand, there were further accretions to producers' stocks of metallic zinc, and large quantities of concentrates are said to be held at the mines. As a consequence of the superabundance of zinc London quotations in sterling sagged to the lowest yearly average since 1933, reaching an extremely low level early in June. Some improvement was noticeable in the last

Digitized by Google

half of the year, but this was offset to a considerable extent by a substantial drop in the foreign exchange value of the pound. Low prices stimulated efforts to revive the Zinc Cartel, but such efforts proved to be fruitless, and at the end of the year the outlook for any relief through cooperative action was dismal.

*Reduction in tariff.*—The 20-percent reduction in the import duty on zinc resulting from the Canadian Trade Agreement signed November 17, 1938, aggravated the already unfavorable competitive position of the domestic zinc industry. As stated in Minerals Yearbook, 1938, domestic producers are at a disadvantage in comparison with foreign producers because of the lower grade of ore found in domestic deposits.

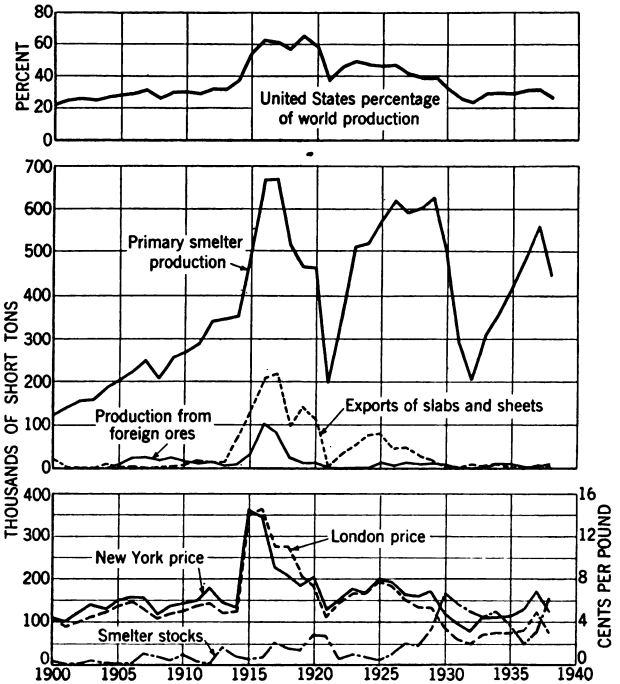

FIGURE 1.—Trends in the zinc industry in the United States, 1900-1938. Imports of slab and sheet zinc are not shown, as they seldom exceed 500 tons annually. In the last few years, however, they have increased, amounting to 11,902 tons in 1936, 37,439 in 1937, and 7,456 in 1938.

Costs of production in the United States also are influenced by higher wage rates in this country. Formerly these basic disadvantages were offset partly by superior technology and mechanization, but in recent years American mining practice has been adopted abroad, particularly at several properties that have begun production in the last decade, and foreign costs of production have been reduced accordingly. The increased output of these new mines has been augmented by subsidized production from submarginal deposits in various countries striving for self-sufficiency and by increased capacity and improved recovery at older mines, all of which have resulted in considerable overproduction. Stocks of both ore and metal have accumulated at mines and smelters with depressing effects on world prices.

Digitized by Google

During the 10-year period 1920–29 the London quotation for prompt metal averaged 6.3 cents per pound. Since then the average has been 3.2 cents, almost a 50-percent decline. New York quotations for the same periods averaged 6.9 cents and 4.8 cents, respectively. That the tariff has been highly effective since 1929 is indicated by the rise of 0.6 cent to 1.6 cents per pound in the average differential between New York and London prices.

Despite the fact that the previous tariff prevented a more drastic drop in domestic prices, zinc mining in many districts of the United States has not been profitable enough in recent years to induce adequate expenditure for exploration and development needed to maintain ore reserves; thus the basic position of the industry has been jeopardized by lack of proper provision for its future. As a consequence some domestic producers considered requesting Congress for further tariff protection as early as 1936 when events abroad prevented the New York quotation from rising above 5.25 cents. Action was postponed, however, by the rise in prices during the extraordinary boom in metals late in 1936 and early in 1937 and by the temporary shortage of zinc in the summer of 1937. After the sharp recession of prices in 1938 the industry was facing the same outlook as in 1936 with the added handicap of a 20-percent cut in its tariff protection.

The ultimate effects of the tariff reduction on the domestic zinc industry cannot be determined at this time. As the previous import duty (1.75 cents per pound) was virtually 100 percent effective prior to the announcement of the Canadian Trade Agreement, it is obvious that to avoid large imports of foreign metal, the domestic price of zinc must be reduced in relation to London prices by approximately the amount the import duty was cut. An immediate effect of the reduction, therefore, has been aggravation of an already serious condition that has resulted from and will continue as long as the depressed market exists abroad.

A review of the present status of foreign production indicates that the foreign price of zinc will remain below predepression averages for an extended period. During the last several years large new producers in Yugoslavia, Newfoundland, northern Spain, Australia, and Canada have come into the market. At most of these properties zinc concentrates are produced largely as a byproduct, and the cost of mining and milling the crude ore is borne by other products, principally lead and silver. Consequently the out-of-pocket cost of zinc concentrates is relatively low because it comprises only the expense of separating the zinc minerals after the ore is mined and crushed. Producers are thus content to sell the zinc at a price that yields a profit over the out-of-pocket cost.

Notwithstanding the low level of prices and the overabundance of present foreign capacity, plans are under way for increasing capacity at several properties, and new mines are being developed. The practice of subsidizing submarginal mines continues to expand, particularly in Germany. The world's demand for zinc evidently can be supplied for many years at prices far below former averages. This conclusion is substantiated by the fact that, except during the boom in 1937, world prices have not returned to predepression levels, although foreign consumption has increased steadily since 1932 and has established new peaks during the past 4 years. In 1938 foreign consumption of zinc was 20 percent greater than in 1929, yet the

Digitized by Google

average London price was only 3.05 cents per pound compared with 5.40 cents in 1929.

Much of the advance in consumption has been due to military preparations engendered by the tense international situation. Should the situation be settled without resort to war the demand for zinc for munitions probably would end abruptly. Substantial quantities of zinc now on hand in matériel might be thrown on the market as scrap, which would add to the present excess.

If all factors are considered the outlook for prices satisfactory to the domestic zinc industry is unfavorable owing to the situation in the foreign market. Substantial improvement there depends primarily on the extent to which producers can cooperate to avoid overproduction. Failure of the various attempts to reestablish the Zinc Cartel since it collapsed in 1934 offers little hope of immediate success in this direction. The recent large increase in the import duty on non-British zinc in the United Kingdom, the self-sufficiency programs of various nations, the shortage of foreign exchange, and the intense competition for the remaining open markets appear to be almost insurmountable obstacles.

If the domestic industry is to continue to supply national requirements it must become adjusted to the lower price level, to which has been added a reduction of 0.35 cent per pound in tariff protection. To do this, costs of production will have to be reduced, chiefly by lowering wages and by selective mining of the higher grade portions of ore deposits, neither of which is desirable. Reduction of wages is contrary to present Government policies of increasing purchasing power, and the robbing of ore bodies is decidedly anticonservational and detrimental to the long-time welfare of the industry.

The alternative would be loss of part of the domestic zinc market to foreign producers. From the standpoint of public interest this likewise would be undesirable because it would aggravate the unemployment problem. Dr. John W. Finch, Director of the Bureau of Mines, has pointed out that it would also be undesirable from the standpoint of national defense. In an address on strategic minerals at the annual meeting of the American Zinc Institute at St. Louis in April 1938 he emphasized the importance of preserving industries that now provide self-sufficiency in important industrial minerals, as follows:

> In this connection I should like to suggest that a reduction in the present tariff on lead and zinc can hardly be considered in the public interest if viewed from the standpoint of national defense. The fact that these metals are produced in large quantities in neighboring countries is not adequate protection, as we have no assurance that supplies could be obtained from these countries in an emergency except at exorbitant cost or by military effort. It seems to me that the maintenance of the security afforded by our ability to supply our own needs of these important industrial raw materials should receive careful consideration.

In the past 12 months the domestic zinc industry has suffered drastic curtailment. Several mines and one smelter, which resumed operations in 1937 after protracted shut-downs, were forced to close again in 1938 on account of low prices. It has been reported that production has continued at many mines in the Tri-State area where the selling price of the product covered operating costs without provisions for depletion, depreciation, or adequate return on capital investment. There were further shut-downs during 1939. Early in May the American Zinc Lead & Smelting Co. notified its employees

Digitized by Google

of its intention to discontinue operation of the slab-zinc division of its East St. Louis smelter, probably before the end of the second quarter of the year. It was stated that this would be the first time that this division has been entirely closed since it was built and put into operation in 1914. According to the company this action was predicated on increased operating costs brought about in the last 3 years by the increased costs of labor, fuel, supplies, and taxes, which make it impossible to operate under current prices for zinc. Later in May, the United Zinc Co., Moundsville, W. Va., announced that effective June 1 a 10-percent cut in salaries and wages would be imposed because of the serious financial condition of the company. According to press reports the workers declined to accept the cut, preferring to go into an unemployed status. The plant was closed on June 1 for an indefinite period.

Import statistics for the first 4 months of 1939 indicate that the quantity of slab zinc entered for consumption totaled 9,350 tons compared with 1,782 tons in the same period of 1938. Information is not available as to how much of this metal eventually will be exported in manufactures with benefit of draw-back. Nevertheless, the large increase in imports in 1939 suggests that substantial quantities of foreign zinc may be invading domestic markets.

The foregoing analysis of the zinc industry indicates clearly that domestic producers are confronted with a critical situation as a result primarily of unsatisfactory conditions abroad. Their effects on the domestic market have been intensified by the 20-percent reduction in tariff.

Since the terms of the Canadian Trade Agreement were made public, representatives of the zinc industry have protested vigorously the reduction in the duty on zinc and have urged the Government to restore the tariff to its former level. This can be accomplished either by the State Department or by Congress. The State Department could initiate action under the provision in the trade agreement that gives each country the right to withdraw or modify the concession granted on any article—

> * * * If, as the result of the extension of such concession to other foreign countries, such countries obtain the major benefit of the concession, and if in consequence imports of the article concerned increase to such an extent as to threaten serious injury to domestic producers.

The State Department has been studying the situation in detail with a view to determining whether the actual effects of the tariff reduction merit such action. Congress could restore the tariff to its former level by legislative enactment, and a bill to do this has been introduced in the present session. It is understood, however, that Congress is reluctant to inaugurate action to restore specific reductions in the various trade agreements by such means as eventually it might vitiate the entire reciprocal-trade-treaty program.

## DOMESTIC PRODUCTION

*Production of primary and secondary slab zinc.*—Production of primary slab zinc from domestic and foreign ores in 1938 declined 20 percent from 1937, was equivalent to 74 percent of the average output for the 5-year period 1925–29, but exceeded by 115 percent the depression low established in 1932.

Digitized by Google

Production from domestic sources decreased 21 percent, whereas that from foreign sources increased 80 percent. Foreign ores smelted in 1938 were obtained almost entirely from Peru and Mexico.

Production of secondary slab zinc fell off 35 percent from 1937. Statistics on remelted secondary zinc for 1937 have been revised, and those for prior years are being revised because some producers of redistilled metal inadvertently have been reporting their production as remelted metal also. Former statistics on production of remelted zinc thus have overstated the actual output of this type of metal.

*Primary and secondary slab zinc produced in the United States, 1934–38, in short tons*

| Year | Primary | | | Secondary | | | Grand total |
|---|---|---|---|---|---|---|---|
| | Domestic | Foreign [1] | Total | Redistilled | Remelted | Total | |
| 1934 | 355,366 | 8,224 | 363,590 | 19,691 | (2) | (2) | (2) |
| 1935 | 412,184 | 8,450 | 420,634 | 28,650 | (2) | (2) | (2) |
| 1936 | 491,803 | 329 | 492,132 | 42,209 | (2) | (2) | (2) |
| 1937 | 551,165 | 5,739 | 556,904 | 51,554 | [3] 12,986 | [3] 64,540 | [3] 621,444 |
| 1938 | 436,007 | 10,334 | 446,341 | 31,613 | 10,657 | 42,270 | 488,611 |

[1] All foreign zinc smelted in the United States in 1934–36 was derived from Mexican ores; in 1937–38, most of it originated in Peru.
[2] Figures in process of revision.
[3] Revised figures.

*Distilled and electrolytic zinc.*—Of the total output of primary zinc in 1938, 79 percent was distilled and 21 percent electrolytic. Production of distilled primary zinc declined 20 percent and that of electrolytic zinc 21 percent. The production of redistilled secondary zinc dropped 39 percent; large decreases occurred at both primary and secondary smelters.

*Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1934–38, in short tons*

APPORTIONED ACCORDING TO METHOD OF REDUCTION

| Year | Electrolytic primary | Distilled primary | Redistilled secondary [1] | | Total |
|---|---|---|---|---|---|
| | | | At primary smelters | At secondary smelters | |
| 1934 | 76,657 | 286,933 | 4,962 | 14,729 | 383,281 |
| 1935 | 118,476 | 302,158 | 13,439 | 15,211 | 449,284 |
| 1936 | 127,175 | 364,957 | 22,142 | 20,067 | 534,341 |
| 1937 | 117,511 | 439,393 | 24,131 | 27,423 | 608,458 |
| 1938 | 93,272 | 353,069 | 14,003 | 17,610 | 477,954 |

APPORTIONED ACCORDING TO GRADE

| Year | Grade A (high-grade) | Grade B (intermediate) | Grade C (brass special) | Grade D (selected) | Grade E (prime western) | Total |
|---|---|---|---|---|---|---|
| 1934 | 116,720 | 32,621 | 43,657 | | 190,283 | 383,281 |
| 1935 | 155,516 | 49,118 | 49,909 | | 194,741 | 449,284 |
| 1936 | 183,841 | 59,879 | 65,728 | | 224,893 | 534,341 |
| 1937 | 196,052 | 67,132 | 72,993 | | 272,281 | 608,458 |
| 1938 | 140,256 | 58,128 | 73,724 | | 205,846 | 477,954 |

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

Digitized by Google

*Production of primary slab zinc by States.*—Pennsylvania continued to be the leading producer of primary slab zinc, Montana replaced Oklahoma in second place, and Illinois again ranked fourth. The output of West Virginia and Texas is shown under "Other States." Production from all States decreased in 1938. All the production in Montana and Idaho is electrolytic zinc, whereas the other States shown produce only distilled zinc.

*Primary slab zinc produced in the United States, by States, 1934–38, in short ton*

| Year | Arkansas | Idaho | Illinois | Montana | Oklahoma | Pennsylvania | Other States [1] | Total | |
|---|---|---|---|---|---|---|---|---|---|
| | | | | | | | | Short tons | Value |
| 1934 | 11,808 | 9,935 | 55,773 | 66,722 | 61,711 | 100,728 | 56,913 | 363,590 | $31,269,00 |
| 1935 | 10,147 | 12,448 | 67,348 | 106,028 | 58,612 | 119,452 | 46,599 | 420,634 | 37,016,00 |

[1] Texas and West Virginia.

*Secondary zinc.*—Besides the redistilled and remelted secondary slab zinc (unalloyed) mentioned previously, a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Details are given in the chapter on Secondary Metals—Nonferrous.

*Byproduct sulfuric acid.*—An important byproduct of zinc smelting is sulfuric acid made from the sulfur dioxide gases evolved from the roasting of zinc blende. Some plants also consume large quantities of sulfur in addition to blende to utilize a larger proportion of their acid-producing capacity. The following table shows the production of sulfuric acid at zinc-blende roasting plants from 1933 to 1937. Data for 1938 are not yet available.

*Sulfuric acid (60° B. basis) made at zinc-blende roasting plants in the United States, 1933–37* [1]

| Year | Made from zinc blende | | Made from sulfur | | Total | | |
|---|---|---|---|---|---|---|---|
| | Short tons | Value [2] | Short tons | Value [2] | Short tons | Value [2] | |
| | | | | | | Total | Average per ton |
| 1933 | 355,027 | $2,676,904 | 242,493 | $1,828,397 | 597,520 | $4,505,301 | $7.54 |
| 1934 | [3] 406,984 | 3,215,173 | 89,162 | 704,380 | 496,146 | 3,919,553 | 7.90 |
| 1935 | [3] 443,476 | 3,756,242 | 90,884 | 769,787 | 534,360 | 4,526,029 | 8.47 |

| 1937 | [3] 542,356 | 5,060,181 | 151,090 | 1,409,670 | 693,446 | 6,469,851 | 9.33 |

[1] Figures for 1938 not yet available.
[2] At average of sales of 60° acid.
[3] Includes acid from small quantity of foreign blende.

*Rolled zinc.*—Production of rolled zinc in 1938 decreased 21 percent from 1937. Some producers fabricate their rolled zinc into various products, and the scrap resulting from these operations is remelted and rerolled. In 1938 the scrap so treated amounted to 9,392 tons compared with 11,062 in 1937. Zinc lost in waste products, such as

Digitized by Google

skimmings and drosses and pot losses, totaled 1,150 tons in 1938—equivalent to about 3 percent of the net production of rolled zinc. Of the zinc purchased for rolling in 1938, 38 percent was brass special, 32 percent prime western, 14 percent selected, 14 percent high grade, and 2 percent electrolytic and intermediate grades. Stocks of slab zinc on hand at zinc-rolling mills were about 9,600 tons at the beginning and about 7,600 tons at the end of the year.

*Rolled zinc produced and quantity available for consumption in the United States, 1937–38*

| | 1937 | | | 1938 | | |
|---|---|---|---|---|---|---|

| Value of slab zinc (all grades) | | | .065 | | | .048 |
| Value added by rolling | | | .032 | | | .038 |

[1] Figures represent net production. In addition, 11,062 tons of strip and ribbon zinc in 1937 and 9,392 tons of strip and ribbon zinc in 1938 were rerolled from scrap originating in fabricating plants operated in connection with zinc-rolling mills.
[2] Includes some slab zinc; not separately recorded.

*Zinc dust.*—The output of zinc dust decreased 24 percent from 1937, the peak year. The zinc content of dust produced in 1938 ranged from 94 to 98.5 percent and averaged 97 percent. Since 1931 virtually all zinc dust has been produced by redistillation of zinc drosses and slab zinc.

*Zinc dust [1] produced in the United States, 1934–38*

| Year | Short tons | Value | | Year | Short tons | Value | |
|---|---|---|---|---|---|---|---|
| | | Total | Average per pound | | | Total | Average per pound |
| 1934 | 10,856 | $1,342,133 | $0.062 | 1937 | 15,242 | $2,587,577 | $0.085 |
| 1935 | 12,453 | 1,574,259 | .063 | 1938 | 11,609 | 1,542,511 | .066 |
| 1936 | 14,425 | 1,957,300 | .068 | | | | |

[1] All produced by distillation.

*Zinc pigments and salts.*—Zinc oxide, leaded zinc oxide, and lithopone are the principal pigments of zinc and chloride and sulfate the principal salts. These products are manufactured from various zinciferous materials—ores, metal, and secondary substances. Details of the production of zinc pigments and salts are given in the chapter on Lead and Zinc Pigments and Zinc Salts.

Digitized by Google

*Mine production.*—Mine production decreased 18 percent in 1938. The Western States suffered the largest decline in both tonnage and percentage, the latter amounting to 25 percent. The reduction in tonnage in the Central States was almost as large, a 19-percent drop in output being recorded. Production in the Eastern States declined only 9 percent; declines in New Jersey and New York were offset in part by increases in Virginia and Tennessee.

Of interest in the Western States are the gains in Washington and New Mexico. The gain in Washington resulted from increased production at two mines in the Metaline district, one of which shut down about midyear after having begun production only in October 1937. New Mexico's increase was due mostly to expanded production in the Central district. Arizona and Colorado recorded smaller increases, but all other States showed major declines.

In the Central States the Tri-State region produced 17 percent less zinc in 1938 than in 1937. The output in 1938 was equivalent to only 55 percent of the average yearly output from 1925 to 1929. The district supplied 38 percent of the total zinc produced in the United States in 1938 compared with 49 percent in the predepression 5-year period, 1925–29. The marginal nature of production in Wisconsin is indicated by the 70 percent decline in that State.

Further details of zinc mining will be found in the various State reports in this volume.

## STOCKS

Total stocks of slab zinc were 97 percent higher at the end than at the beginning of 1938, and year-end inventories on December 31, 1938, were the highest since 1930. Metal on hand at primary reduction plants increased 99 percent, while that at secondary distilling plants decreased 3 percent. Total stocks at the end of 1938 included 75,864 tons of the higher grades of zinc (A and B) and 83,562 tons of the lower grades (C, D, and E) compared with 36,996 and 44,117 tons, respectively, at the end of 1937.

According to the American Zinc Institute zinc stocks reached a peak at the end of June 1938 which was greater than the depression high established near the close of 1930. In the succeeding 5 months, however, shipments to consumers improved. Inventories declined steadily but in December rose substantially as demand fell and production increased.

*Stocks of zinc on hand at zinc-reduction plants in the United States at end of year, 1934–38, in short tons*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| At primary reduction plants | 124,783 | 90,539 | 55,500 | 79,144 | 157,511 |
| At secondary distilling plants | 2,685 | 1,151 | 626 | 1,969 | 1,915 |
| | 127,468 | 91,690 | 56,126 | 81,113 | 159,426 |

Stocks of zinc ore in the Tri-State district showed a net decline for 1938. On January 1 about 15,000 tons of concentrates (sold and unsold) were on hand with an estimated recoverable zinc content of 8,000 tons. In the spring months demand for ore was sharply cur-

Digitized by Google

tailed as stocks of metal at smelters mounted rapidly. By July 2 ore on hand reached a peak for the year of 27,000 tons, equivalent to about 14,000 tons of metal, but in the remaining 6 months ore shipments were considerably higher, and at the close of the year stocks were only 8,400 tons of ore, equivalent to 4,400 tons of metal.

O. W. Roskill, of London, in his review of the European and world zinc situation in 1938 at the annual meeting of the American Zinc Institute, Inc., at St. Louis in April 1939, estimated producers' stocks of metallic zinc outside the United States at 195,000 to 210,000 metric tons at the beginning of 1938 and 270,000 to 280,000 tons at the end. On this basis world stocks may be estimated to have increased from a maximum of about 310,000 short tons on January 1 to a maximum of 470,000 tons on December 31, 1938. The Consolidated Mining & Smelting Co. of Canada, Ltd., in its annual report for 1938, estimated world stocks at 300,000 short tons at the end of 1937 and 425,000 tons at the end of 1938. In addition large stocks of concentrates are held by European smelters and various mining companies throughout the world.

## DOMESTIC CONSUMPTION

*New supply.*—The supply of new zinc available for consumption in 1938 decreased 34 percent from 1937. Declines of 41, 24, and 48 percent, respectively, were recorded for copper, lead, and pig iron. Compared with 1925–29 averages, apparent consumption of zinc in 1938 dropped only 32 percent, whereas that of copper, lead, and pig iron decreased 48, 51, and 52 percent, respectively.

*Primary slab zinc available for consumption in the United States, 1934–38, in short tons*

| | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Supply: | | | | | |
| Stock at smelters Jan. 1 | 110,487 | 124,783 | 90,539 | 55,500 | 79,144 |

[1] Not separately recorded; estimated.

*Industrial use of slab zinc.*—In addition to the new supply noted in the preceding table, a large tonnage of secondary zinc is available each year for industrial use. The American Bureau of Metal Statistics estimates the total industrial use of primary and secondary zinc during the past 5 years as follows:

Digitized by Google

*Estimated industrial use of zinc in the United States, 1934–38, in short tons* [1]

| Purpose | 1934 | 1935 | 1936 | 1937 | 1938 |

[1] Year Book, American Bureau of Metal Statistics, 1938.
[2] Includes pole-line hardware, hollow ware, chains, and all articles not elsewhere mentioned.
[3] Includes slab zinc used for manufacture of French oxide, zinc for wet batteries, slush castings, the delverization of lead, and sundries.

The industrial use of zinc in 1938 was 31 percent lower than in 1937 nd equivalent to only 66 percent of the record established in 1929. \ll four major uses of zinc decreased in 1938; die casting 45 percent, rass making 40 percent, and galvanizing and rolled zinc 21 percent ach. Galvanizing took 47 percent of the total tonnage used in 1938 ompared with 42 percent in 1937. The totals for this item include inc used in electrogalvanizing and sheridizing. The former decreased rom 5,443 tons in 1937 to 3,978 in 1938 and the latter from 701 to 264 ons.

Zinc used in rolled products in 1938 (1937 figures in parentheses) ncluded 15,300 tons (18,500) in battery cans, 15,000 (17,000) in glass-ar tops, 2,000 (6,000) in automobile manufacture, 4,000 (4,750) in photoengraving sheet, 830 (1,200) in boiler plate, 270 (625) in brake ining, and 300 (400) in electric refrigerators. The remaining ton-nages were employed for various other uses or exported.

The principal item included in "Other uses" is the slab zinc used n the manufacture of French-process zinc oxide which amounted to bout 16,000 tons in 1938 compared with about 24,000 tons in 1937.

## PRICES

The downward trend in prices that was evident in the last quarter of 1937 continued the first half of 1938. From 5.00 cents at the beginning of the year, the St. Louis quotation for prime western metal gradually declined to 4.00 cents early in April as consumer interest waned and stocks mounted. Following announcement of the Administration's spending program to revive business there was a brief flurry upward, but by May 10 the price had settled again to 4.00 cents, the low for the year, where it remained until the latter part of June. At this time buying improved, and by July 1 the quotation had risen to 4.75 cents. Despite reductions in producers' stocks in July and August no further change occurred until the middle of September, when quotations again began moving upward. The high for the year,

Digitized by Google

5.05 cents, was established on October 13 and maintained through November 18, when the price was reduced to 4.75 cents over the week-end following the announcement of the 0.35 cent per pound tariff cut as a result of the Canadian Trade Agreement. Although the reduced tariff was not effective until January 1, 1939, the cut in price at this time, according to trade reports, was a protective measure to discourage domestic consumers from contracting for forward metal from foreign producers. A further reduction to 4.50 cents took place on November 29, and this price level was held throughout December. The average for the year, 4.61 cents, was 29 percent below the average for 1937.

In London the decline in prices was more pronounced than in domestic markets, the average for 1938 having decreased 38 percent from that for 1937. The differential between New York and London increased from 1.49 cents per pound in April to 2.28 cents in November. At the close of the year the differential was 1.98 cents. The average differential for 1938 was 1.94 cents compared with 1.96 in 1937.

The trends in the New York and London prices during the last half of November are of interest in view of the sudden announcement on November 18 of the impending reduction in the United States import duty. From November 15 to 18 the differential rose from 2.42 to 2.46 cents, but after the sharp reduction in domestic prices on November 21 it fell to 2.19 cents. The following day the London quotation dropped 6 points bringing the differential back to 2.25 cents. On November 23 the foreign price recovered 5 points to 2.20 cents below the New York price. It then moved to lower levels and on November 28 was 2.29 cents under the New York quotation. Following the 0.25-cent cut in domestic prices on November 29, the differential declined to 2.05 cents and then to 1.98 cents on November 30, as London prices recorded a 0.07-cent advance.

New York), 1934, 5.24 cents; 1935, 5.33 cents; 1936, 5.90 cents; 1937, 7.76 cents; 1938, 5.74 cents; brass special (f. o. b. East St. Louis), 1934, 4.23 cents; 1935, 4.41 cents; 1936, 4.98 cents; 1937, 6.62 cents; 1938, 4.71 cents.

## ZINC-REDUCTION PLANTS

*Zinc smelters.*—At the close of 1938 there were 19 primary zinc-distillation plants in the United States—17 active during the year and 2 idle. Except for 224 retorts added to existing blocks at the Bartlesville plant no new capacity was installed in 1938. The Van Buren plant, which had been idle since 1927 and was rehabilitated and put into operation during 1937, was active part of 1938, but was idle at the end of the year. Of the 17 active plants, 13 operated exclusively with horizontal retorts, 1 with both horizontal and vertical retorts, 2 with large vertical retorts exclusively, and 1 with electrothermic furnaces. At the active plants 69,180 horizontal retorts were available, and 33,949 were in use at the end of the year. In addition, 46 of the 52 installed vertical retorts were operating at the close of 1938.

Many primary smelters treat scrap as well as ore. Horizontal-retort plants at Beckemeyer and Sandoval, Ill., and large graphite-retort plants at Trenton, N. J., Philadelphia and Bristol, Pa., Wheeling, W. Va., and Tottenville, N. Y., operate exclusively on scrap.

Digitized by Google

The Torrance (Calif.) plant of Pacific Smelting Co., Ltd., contains small clay retorts as well as large graphite retorts for treating secondary materials. W. J. Bullock is operating a new large graphite-retort plant at Fairfield, Ala.

*Electrolytic plants.*—The Evans-Wallower Zinc Co. plant at East St. Louis continued idle in 1938 despite rumors that it was to be reopened. The Anaconda and Great Falls (Mont.) plants of the Anaconda Copper Mining Co. operated at greatly reduced capacity in 1938. Both plants were closed during part of January and February. The Kellogg plant of the Sullivan Mining Co. completed a 50-percent increase in plant capacity in 1938. Two of the three units were operated during the first quarter of 1938, but only one unit was used the remainder of the year. At the three active plants 1,460 cells out of a total of 2,192 were in use at the end of 1938.

## TECHNOLOGY

Despite market conditions in 1938, which hardly warranted expenditures for improving plants and technique, there were several interesting developments in technology.

*Mining.*—The practice of replacing ore pillars with concrete now being developed in the Southeast Missouri lead district is being considered in the Tri-State area, where pillars constitute 7 to 10 percent of the mineralized areas. The D. C. & E. mine at Oronogo, Mo., has been completely mechanized on an experimental basis, using scrapers, conveyers, skips, and other modern equipment; mining costs are reported to be half the average of the district. Development work at the Grasselli mine, New Market, Tenn., which began production in 1937, consisted largely of preparation for mill-hole and slusher hoist operations.

*Milling.*—The heavy-density cones at Mascot, Tenn., continued to operate satisfactorily throughout 1938. Additional equipment, installed to increase capacity, resulted in decreased milling costs and higher recoveries. Experimentation with a similar process continued at the Central mill of the Eagle-Picher Mining & Smelting Co., Picher, Okla. In the western lead-zinc areas Engelmann [2] reports that minerec "A" is used in 80 percent of the plants where it has partly or completely replaced xanthate in the lead circuits. Sodium Aerofloat is used extensively as a zinc promoter. He also states that the Fagergren flotation machine is finding favor with lead-zinc operators.

*Reduction.*—Aside from the 224 retorts added to existing furnaces at Bartlesville, no new domestic smelting capacity was built in 1938. Sinn [3] reports that outputs per retorts and recoveries have been improved at domestic horizontal-retort smelters. In European plants larger retorts are being used; daily production of more than 70 pounds of zinc per retort is common practice at 90 percent or better recovery, and 90-pound outputs are being considered. Because of the superior quality of European clays, which permits higher temperatures, it is possible to use larger retorts in Europe than in the

[2] Engelmann, E. W., Ore Concentration and Gold Milling: Min. and Met., vol. 20, No. 385, January 1939, pp. 13–14.

Digitized by Google

United States. Prolongs also are used in European plants, and American producers probably lose at least 5 percent of their zinc by not following European practice in this respect. General progress in process improvement was reported by the large vertical-retort smelters and the electrothermic smelting plant at Josephtown, Pa. Two additional Waelz kilns were constructed, making a total of eight in use at retort smelters and zinc oxide plants in the United States.

The 50-percent addition to the electrolytic zinc plant in Idaho was put into production in 1938, but this plant as well as those at Anaconda and Great Falls, Mont., operated at only partial capacity throughout the year. Emphasis is being placed on increasing the production of 99.99+ percent metal. Electrogalvanizing of wire is progressing, and production of sheets by the same process is being considered. New electrolytic zinc plants are planned for Yugoslavia, Rumania, and Peru, and the feasibility of another in Quebec for treating Noranda and other ores is being investigated.[4]

## FOREIGN TRADE[5]

*Imports.*—The following tables give zinc imports into the United States, 1934–38, inclusive, and a record of bonded-warehouse inventories.

*Zinc ores (zinc content) imported into the United States, 1934–38, in short tons* [1]

| Year | Canada | Mexico | Other countries | Total | Year | Canada | Mexico | Other countries | Total |
|---|---|---|---|---|---|---|---|---|---|
| 1934 | (2) | 14,277 | (2) | 14,277 | 1937 | 84 | 338 | [3] 8,390 | 8,812 |
| 1935 | | 10,520 | | 10,520 | 1938 | | 7,253 | [3] 11,330 | 18,583 |
| 1936 | | 172 | | 172 | | | | | |

[1] Data include ore imported for immediate consumption plus material entering the country under bond.
[2] Less than 1 ton.
[3] Includes 8,373 tons imported from Peru in 1937; all from Peru in 1938.

*Zinc* [1] *remaining in warehouse in the United States, December 31, 1934–38*

| | Pounds | | Pounds |
|---|---|---|---|
| 1934 | 14,354,435 | 1937 | 24,904,405 |
| 1935 | 13,840,586 | 1938 | 51,058,378 |
| 1936 | 10,690,832 | | |

[1] Includes zinc ore (zinc content), zinc blocks, pigs, old, and sheets.

Imports of zinc ore in 1938 increased 111 percent over 1937 owing to large increases in shipments from Mexico and Peru. Those of slab zinc decreased 81 percent from 1937, the peak year. Of the 7,230 tons received, Mexico furnished 3,346, Canada 2,332, Poland and Danzig 1,210, Belgium 286, and other British South Africa 56.

*Zinc imported for consumption in the United States, 1934–38*

| Year | Blocks, pigs, or slabs | | Sheets | | Old, dross, and skimmings [1] | | Zinc dust | | Value of manufactures | Total value |
|---|---|---|---|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value | Short tons | Value | | |
| 1934 | 1,725 | $112,923 | 55 | $6,978 | | | 18 | $1,395 | $8,523 | $129,819 |
| 1935 | 4,444 | 270,350 | 112 | 9,423 | 29 | $979 | 40 | 2,486 | 1,149 | 284,387 |
| 1936 | 11,660 | 770,496 | 242 | 23,077 | 16 | 769 | 57 | 3,647 | 540 | 798,529 |
| 1937 | 37,208 | 3,852,884 | 231 | 30,398 | 678 | 70,460 | 69 | 6,169 | 828 | 3,960,739 |
| 1938 | 7,230 | 480,169 | 226 | 25,989 | 96 | 8,944 | 64 | 5,074 | 463 | 520,639 |

[1] Includes dross and skimmings: 29 tons valued at $974 in 1935; 15 tons valued at $721 in 1936; and 560 tons valued at $59,635 in 1937. No imports reported in 1938.

*Exports.*—The total value of the 1938 exports of zinc ore and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) was approximately $1,271,000, a decrease of 18 percent from 1937. Exports of plates, sheets, pigs, and slabs decreased 5 percent, while those of zinc dust increased 5 percent in quantity but decreased 15 percent in value. Besides the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. The American Bureau of Metal Statistics estimates that 13,300 tons of zinc were exported in galvanized products in 1938 compared with 13,900 tons in 1937. Export data on zinc pigments and chemicals are given in the chapter on Lead and Zinc Pigments and Zinc Salts in this volume. Much of the zinc used in the manufacture of these products is of foreign origin, and when it is exported a draw-back is paid amounting to 99 percent of the import duty. In 1938 draw-back was paid on 11,550 tons of zinc, of which 7,989 tons had been imported as slabs and 3,561 tons as ore. Totals for previous years were: 1937, 9,253; 1936, 8,909; 1935, 7,297; and 1934, 4,139.

*Zinc ore and manufactures of zinc exported from the United States, 1934–38*

| Year | Zinc ore, concentrates, and dross (zinc content) | | Pigs or slabs | | Plates and sheets | | Zinc dust | |
|---|---|---|---|---|---|---|---|---|
| | Short tons | Value | Short tons | Value | Short tons | Value | Short tons | Value |
| 1934 | 3,621 | $157,419 | 5,105 | $284,023 | 3,462 | $569,208 | 1,489 | $223,868 |
| 1935 | 461 | 10,818 | 1,617 | 83,925 | 4,813 | 755,033 | 1,613 | 238,158 |

## WORLD ASPECTS OF ZINC INDUSTRY

*Cartel activities.*—Efforts to reconstitute the International Zinc Cartel which collapsed in 1934 were stimulated in 1938 by declining prices and mounting stocks of ore and metal but without success. Among the unsurmountable obstacles is the nationalistic policy of Germany and Italy, who refuse to consider any curtailment of output within their confines, despite its uneconomic character. The agitation for a large increase in the British tariff on zinc, designed to exclude non-British zinc from the United Kingdom, was another barrier. Still another obstacle, pointed out by Roskill,[6] is the apathy of custom smelters and ore producers toward cutailment of production. The custom smelter is more interested in treating a large volume of ore on a per-ton basis than in maintaining prices. Although this is a short-sighted policy and in the long run is detrimental to the best interests of the custom smelter, it undoubtedly prevails at present because the future of international relations is so uncertain. The producer's attitude is due to the byproduct nature of zinc, and mine operators are disposed to maintain lead and silver production schedules without regard to the resulting overproduction of zinc. The present outlook for international cooperation in the slab-zinc industry certainly cannot be considered hopeful.

In February 1938 an International Zinc Sheet Cartel was formed and eventually included producers in 10 countries—the United Kingdom, Belgium, the Netherlands, Germany, France, Spain, Hungary, Poland, Yugoslavia, and Czechoslovakia. Italy was not included, but Belgian control of Italian rolling mills was expected to prevent any disturbing influence from this source.

*World production.*—World production of zinc (smelter basis) decreased 4 percent from the record established in 1937. This decline

[6] Roskill, O. W., Lead, Zinc, and Cadmium in 1938: Min. Jour., London, vol. 204, No. 5402, Mar. 4, 1939, pp. 169–171.

Digitized by Google

was due entirely to the 20-percent drop in United States production, as the total output elsewhere increased 4 percent to a new all-time peak. Compared with 1929, production in the United States in 1938 decreased 29 percent, whereas that of the rest of the world increased 30 percent. The United States proportion of the world total was 39 percent in 1929, 31 percent in 1937, and only 26 percent in 1938. There were also notable declines in output in Belgium, Italy, Northern Rhodesia, and the United Kingdom and substantial increases in Canada, Germany, Japan, Norway, and the U. S. S. R. in 1938.

*World smelter production of zinc, 1934–38, in metric tons, by countries where smelted*

[Compiled by R. B. Miller]

| Country | 1934 | 1935 | 1936 | 1937 | 1938 |

[1] Some secondary material included.

[2] Approximate production.

*World consumption.*—World consumption of slab zinc, according to the American Bureau of Metal Statistics, amounted to 1,487,000 metric tons, 9 percent less than in 1937. Consumption in the United States decreased 33 percent, whereas that of the rest of the world increased 3 percent and established a new peak. The international armament race continues to play an important part in maintaining consumption abroad, and undoubtedly some nations are accumulating war stockpiles of zinc. Zinc consumption in the United States in 1938 declined 31 percent compared with 1929, but that elsewhere rose 20 percent.

The United States again ranked first in zinc consumption, taking 25 percent of the total. Germany ranked second with 18 percent, and the United Kingdom third with 14 percent. Belgium used 7 percent, France and Japan each 6, and U. S. S. R. 5 percent. Of the foregoing countries, Germany, U. S. S. R., Japan, and Belgium used 11, 11, 6, and 2 percent more zinc than in 1937, respectively, whereas the United Kingdom and France used 9 and 3 percent less, respectively.

## REVIEW BY COUNTRIES

*Australia.*—The electrolytic zinc plant at Risdon continued capacity operation in 1938. Approximately one-third of the product is obtained from Tasmanian ores and two-thirds from Broken Hill ores.

Digitized by Google

In the Broken Hill district interest centered in the development of the New Broken Hill mine, which is expected to begin production in 1940, and exhaustion of the Broken Hill Proprietary mine, which closed early in February 1939. The latter began operations in 1885 and has produced 12,300,000 long tons of ore yielding 1,445,000 tons of lead, 189,457,000 ounces of silver, and 603,000 tons of zinc. At North Broken Hill the new concentrator, capacity 50,000 tons per month, was placed in operation April 11, 1939. The Zinc Corporation continued the enlargement of its mill and surface equipment in anticipation of treating the ore from the adjoining New Broken Hill mine; a new shaft is being sunk that will serve both mines. Crude-ore production of the district was approximately 1,545,000 tons, an increase of 77,000 tons over 1937.

Mt. Isa made a profit of £19,742 in the year ended June 30, 1938, compared with £70,309 in the previous year. In the last fiscal year 609,377 tons of ore were produced, of which 594,752 tons were milling ore containing 9.8 percent zinc, 8.9 percent lead, and 7.3 ounces of silver per ton. Ore reserves were estimated at 9,354,500 tons. Milling methods and costs have been described by Kruttschnitt [7] and others.

The Lake George mine began production in January 1939 when the first 500-ton-per-day unit of the concentrator was started. Another 500-ton unit is contemplated.

Total mine production of zinc in Australia was estimated at 178,500 tons in 1938. Exports of metallic zinc totaled 38,000 tons compared with 39,500 tons in 1937. Nearly 194,000 tons of concentrates were shipped abroad in 1938 as against 187,000 tons in 1937.

*Belgium.*—Imports of zinc ore totaled 537,000 metric tons in 1938, a decline of 13 percent from 1937. Mexico supplied 27 percent of the total. Other important sources were British India, Sweden, Yugoslavia, Canada, Newfoundland, Australia, Italy, and Spain. Receipts from Spain and Italy increased, but those from the other countries decreased. Exports of slab zinc declined from 151,000 to 130,000 tons; shipments to the United Kingdom decreased, while those to Germany increased. Exports of zinc sheets and wire dropped from 47,000 to 38,000 tons. Imports of slab zinc were reduced from 24,000 to 14,000 tons. Vieille Montagne produced nearly 110,000 tons of zinc at its various plants in Belgium and elsewhere, 7 percent less than in 1937. The entire reduction was in retort metal, as the output of electrolytic zinc was maintained at full capacity—37,000 tons.

*Burma.*—The Burma Corporation, Ltd., produced 60,744 long tons of zinc concentrates averaging over 58 percent zinc in 1938, compared with 73,552 tons averaging slightly under 58 percent in 1937. The decline in output was due to the reduced zinc content of the ore mined in 1938. The concentrates are shipped chiefly to Belgium. Imports of slab zinc into British India, used largely in galvanizing, declined from 24,000 to 21,000 tons.

*Canada.*—Seventy-eight percent of Canada's production of metallic zinc in 1938 was made at Trail and 22 percent at Flin Flon. Both plants increased their output over 1937. Construction of a third

[7] Kruttschnitt, J., Jacobsen, L. K., and Gross, K. B., Milling Methods and Costs of the Mt. Isa Mines, Ltd., Mount Isa, Queensland, Australia: Bureau of Mines Inf. Circ. 7073, 1939, 33 pp.

Digitized by Google

electrolytic zinc plant has been mentioned as a possibility by the Minister of Mines for Quebec. The plant would provide a market for zinc concentrates from the Waite Amulet, Normetal, Noranda, and Quebec Manitou mines. Shawinigan Water & Power Co. is said to be interested in the project which would be financed by American capital. Reserves of copper-gold-silver-zinc ore at the Waite Amulet property were increased extensively by new discoveries in 1938. Exports of zinc ore from Canada declined from 33,000 to 23,000 short tons, the bulk of which was consigned to Belgium. Exports of slab zinc in 1938 totaled 132,000 tons compared with 134,000 in 1937. The United Kingdom took nearly 100,000 tons and Japan 15,000 tons in 1938; both countries increased their purchases.

*France.*—Although the smelter output of zinc increased only slightly, imports of zinc ore increased 22 percent. Of the 192,000 metric tons received in 1938, 54,000 came from Mexico, 32,000 from other North America, 23,000 from Turkey, 16,000 from Yugoslavia, 15,000 from Sweden, 12,000 from Italy, and 40,000 from other countries. Exports of zinc ore declined from 55,000 to 38,000 tons; these ores move largely to Norway after removal of the sulfur. France also imports large quantities of slab zinc—32,000 tons in both 1937 and 1938. There is a small subsidized ore production in France and the French colonies.

*Germany.*—Much of the 17-percent increase in Germany's smelter output in 1938 resulted from enlargement of the Magdeburg electrolytic zinc plant, the annual capacity of which was increased from 40,000 to 60,000 metric tons. Some of the older retort furnaces have been rehabilitated to increase their output. Construction of a second unit of 8 continuously operated vertical retorts at Oker will be completed in 1939, and construction of 16 additional retorts has begun. Two old smelters were acquired with the annexation of Sudeten Czechoslovakia, the production of which has amounted to 7 or 8 thousand tons annually in recent years, largely from imported ore, however. Mine production in Germany made some progress in 1938, and new developments in treating the zinciferous pyrite and cinder at Meggen probably will increase domestic output considerably. Imports of slab zinc increased from 71,000 to 75,000 tons in 1938 and of zinc ore from 146,000 to 185,000 tons. Exports of zinc ore also increased, from 45,000 to 47,000 tons, and those of crude zinc rose from 100 to 6,900 tons.

*Indochina.*—In view of recent Japanese aggression in southeastern China the zinc production of Indochina is of interest. In 1938, 4,447 metric tons of metallic zinc were produced compared with 4,204 tons in 1937. A smelter at Quang Yen, Tonkin, treats 45-percent concentrates from the mines at Chodien. Virtually all the metal is exported to France. No ore was exported in 1938.

*Italy.*—Apparently Italy's zinc requirements declined in 1938 as there was a 10-percent reduction in smelter output. Production of zinc ores, however, increased from 182,000 to 202,000 metric tons as a result of the pressure to increase lead production. Exports were well maintained at 74,000 tons, of which a large part went to Belgium, Poland, and France. Italy's foreign trade in metallic zinc is no longer important. The lead-zinc deposits of the Arbus area, Sardinia, have

Digitized by Google

been described by Wright.[8] A new plant for recovering secondary zinc is being erected in Genoa.

*Japan.*—Publication of official statistics was discontinued in 1937, so details for 1938 are not available. Showa K. K. apparently has decided to build the new electrolytic plant at its Hibi works in Okayama Prefecture. The plant will have a monthly capacity of 500 tons of metal. It is also stated that the company is to mine and smelt 6,000 tons of zinc annually in Chosen. Zinc was reported to be scarce during 1938, and on August 1 official control of supplies was established. Restrictions were placed on the use of zinc for foil or tubes and in alloys for export trade.

*Mexico.*—Mine production totaled 172,000 metric tons in 1938 compared with 155,000 tons in 1937. Smelter output amounted to only 36,000 tons in 1938, leaving approximately 130,000 tons (260,000 tons of 50-percent concentrates) available for export after allowing for smelter losses on ores treated in Mexico. Mexican export figures do not report shipments of zinc ore or concentrates separately. However, reported receipts of Mexican ore in 1938 were: Belgium 147,000 tons, France 54,000, the United States approximately 15,000, Germany 12,000, the Netherlands 6,000, and Poland 4,000. Mexican trade returns for 1938 report shipments of 5,200 tons of zinc to Japan and 900 tons to Manchuria. The Rosita smelter experienced labor troubles the latter part of the year.

*Newfoundland.*—Production of zinc concentrates totaled 122,000 short tons in 1938 compared with 120,000 tons in 1937. The 1938 product contained 63,000 tons of zinc and 470,000 ounces of silver. Lead and copper concentrates contained an additional 11,000 tons of zinc.

*Peru.*—The Cerro de Pasco Copper Corporation has been considering construction of an electrolytic zinc plant in Peru for several years. Apparently the project finally has been approved, as the president of the company stated at the stockholders' meeting in May 1938 that $3,500,000 to $4,500,000 was to be spent for this purpose. A pilot plant was under construction in January 1939. Peruvian exports of zinc concentrates declined from 29,000 metric tons in 1937 to 25,000 in 1938.

*Poland.*—Exports of slab zinc declined from 69,402 metric tons in 1937 to 58,123 in 1938 and imports of zinc ore from 116,000 to 104,000 tons. Mine production rose from 63,000 to 67,000 tons (recoverable content). Giesche Spolka Akcyjna increased its output of slab zinc from nearly 43,000 tons to nearly 51,000 but reported a loss of 998,027 zlotys for the year ending March 31, 1938.

*Spain.*—Production at the Reocin mine was reported to be approaching normal in May 1938, when the Arnao smelter was said to be producing at the rate of about 8,000 metric tons of zinc annually. French receipts of Spanish ore declined from 32,500 tons in 1937 to 1,200 in 1938, whereas German and Belgian importations increased materially.

*United Kingdom.*—The British Metal Corporation, Ltd., estimates consumption of zinc at 180,000 long tons in 1938, a decrease of 24,000 tons from 1937. Of the 1938 total, 63,000 tons were used for galvanizing (29,000 for sheet and 34,000 for other galvanizing), 52,000 tons

[8] Wright, Charles Will, The Lead-Zinc Deposits and Geology of the Arbus Area in Sardinia, Italy: Econ. Geol. vol. 34, No. 1, 1939, p. 82.

Digitized by Google

for brass, 29,000 tons for oxide, 20,000 tons for rolled products, 12,000 tons for die casting, and 4,000 tons for miscellaneous uses. Approximately 30 percent of the slab zinc used was supplied by domestic smelters operating largely on imported ores and 70 percent by imported metal. Imports of ore totaled 158,000 tons in 1938, of which nearly 110,000 tons came from Australia and over 45,000 tons from Newfoundland; 151,000 tons of ore were imported in 1937. Imports of slab zinc fell from 177,000 to 165,000 tons. The larger part of the metal likewise is obtained from other British countries. Shipments from Belgium declined from 57,000 to 37,000 tons. Stocks of zinc in official warehouses were 20,200 tons at the beginning and 25,400 at the close of the year. Mine production increased only slightly and amounted to approximately 6,000 tons of recoverable zinc.

Agitation for increased tariff protection for the domestic smelting industry continued during 1938. The present import duty on non-British zinc is 12s. 6d. per ton or 10 percent ad valorem, whichever is less. Early in 1939 it was proposed to raise the import duty to 30s. with a corresponding rise in the premium on Empire zinc. Of the 17s. 6d. increase in premium on Empire zinc, 10s. would be paid to Imperial Smelting Corporation as a direct subsidy and 5s. would go into a rebate pool from which zinc manufacturers would be paid draw-back on exported goods. It was reported that consumers objected to this scheme.

*Yugoslavia.*—Trepca Mines, Ltd., treated 655,892 metric tons of ore from its own mines in the year ended September 30, 1938, compared with 638,729 tons in the previous year. Despite the larger tonnage of ore treated the quantity of zinc concentrates produced increased only from 69,863 to 70,120 tons. In addition 101,608 tons were milled for Kopaonik Mines, Ltd., from October 1, 1937, to June 10, 1938, at which time production at the Vojetin mine of the company was discontinued because of low prices. In August 1938, the properties of the Kopaonik, Zletovo, and Novo Brdo companies were absorbed by Trepca Mines, Ltd. An agreement has been made with the Government whereby Trepca will construct an electrolytic zinc plant at Sobac with an annual capacity of 10,000 tons of metal. In the fiscal year 1938 Trepca shipped 8,000 tons of concentrates to local smelters and exported 62,000 tons, chiefly to Belgium and France.

# LEAD AND ZINC PIGMENTS AND ZINC SALTS

By H. M. MEYER AND A. W. MITCHELL

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| General summary | 171 | Consumption by industries—Continued | |
| Salient statistics | 171 | Leaded zinc oxide | 177 |
| Production | 172 | Lithopone | 177 |
| Lead pigments | 173 | Zinc sulfide | 178 |
| Zinc pigments and salts | 173 | Zinc chloride | 178 |
| Consumption by industries | 174 | Zinc sulfate | 178 |
| White lead | 174 | Raw materials used in manufacture | 178 |
| Basic lead sulfate | 175 | Producers and plants | 180 |
| Litharge | 175 | Prices | 181 |
| Red lead | 176 | Foreign trade | 182 |
| Orange mineral | 176 | Lead pigments and salts | 183 |
| Zinc oxide | 176 | Zinc pigments and salts | 184 |

The lead and zinc pigments industry was affected adversely by unsatisfactory conditions in the principal industries that consume pigments—manufacturers of paint, automobiles, pneumatic tires, and storage batteries. On the whole pigment consumption was at a low level in the early months of the year and improved with general industrial conditions in the third quarter. Despite declines in the final quarter most pigments were selling higher than their lowest levels of the year as 1938 ended.

*Salient statistics of the lead and zinc pigments industry of the United States, 1925–29 (average) and 1934–38*

| | 1925–29 (average) | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|---|
| Production (sales) of principal pigments: | | | | | | |
| White lead (dry and in oil) short tons | 154,483 | 78,734 | 96,831 | 118,407 | 98,213 | 98,983 |
| Litharge do | 84,845 | 68,733 | 79,930 | 86,246 | 83,902 | 68,711 |
| Red lead do | 41,362 | 26,743 | 28,776 | 34,896 | 33,931 | 30,183 |

Apparently Japanese restrictions on imports of zinc metal and residues have seriously curtailed zinc oxide trade in that country. According to the Bureau of Foreign and Domestic Commerce[1] the annual production of zinc oxide in Japan was estimated at 30,000 tons, requiring about 35 percent of the total zinc imports into the country. The report also stated that most of the zinc oxide produced is consumed domestically, about 40 percent going to the paint and varnish trades and 30 percent to rubber manufacturers. A later report stated that the restrictions noted were forcing substitution of titanium pigments and lithopone for zinc oxide.

Two articles[2] published in 1938 may be of interest to the pigments industries.

Although zinc pigments fell 22 percent in total quantity compared with only 9 percent for lead pigments, they actually fared better than the latter, for they declined only 17 percent in total value compared with 21 percent. Of the principal pigments sold the average values received by producers ranged from 11 to 15 percent lower for lead pigments compared with gains in average values for zinc pigments of 1 to 14 percent. Zinc pigments made a better showing in relation to 1925–29 averages also, the total value of zinc pigments in 1938 being 56 percent of the average for 1925–29 compared with 47 percent for lead pigments. The continuing trend toward leaded grades of zinc oxide is shown in the decline of only 5 percent in pigments of this class from the high record tonnages for 1937 and 1936 compared with a decline of 31 percent from 1937 in lead-free zinc oxide. The quoted prices for lead pigments in general followed those for pig lead, receding to the low point of 1938 in midyear and rising in the third quarter. Zinc pigments were unresponsive to price changes for the metal. Prices for some were unchanged from quotations for 1937 and for others were established throughout the year at the best levels attained in 1937.

Titanium pigments again absorbed a larger share of the market for white pigments than in previous years.

## PRODUCTION

In this report sales are used as being more significant than production, for no account is taken of stocks on hand at the beginning and end of the year. The quantities consumed by the producers in manufacturing products at their own plants are included under sales. Production figures are used only in calculating the metal content of pigments and salts in the section of this report on Raw Materials Used in the Manufacture of Lead and Zinc Pigments and Zinc Salts.

The total value of lead and zinc pigments dropped from $63,714,000 in 1937 to $51,505,000 in 1938—only about one-half of the average annual total for 1925–29. The decline is explained by smaller total sales of all important pigments except white lead and by lower sales values of the lead pigment group. The higher average values received for zinc pigments in a small measure offset the drop in tonnage for this group.

*Lead pigments.*—Sales of all lead pigments except white lead in oil declined in 1938. White lead (dry) sales dropped 12 percent but the 7-percent increase in sales of white lead in oil was sufficient to explain a 1-percent increase in total white lead sales. Red lead sales were 11 percent lower and those for litharge and basic lead sulfate 18 percent and 33 percent lower, respectively. The figures for basic lead sulfate do not represent a true picture of the quantities of this pigment consumed, as they are exclusive of the amounts used in the manufacture of leaded zinc oxide. This use of basic lead sulfate has expanded sharply in recent years, and in 1938 about 7,000 tons was so consumed. Litharge made the best showing in relation to 1925–29 averages, the total for 1938 representing 81 percent of the average for 1925–29, while sales of red lead and white lead (dry and in oil) were 73 and 64 percent, respectively.

*Zinc pigments and salts.*—Sales of leaded zinc oxide in 1938 were only 5 percent below the record tonnages for 1936 and 1937, but those for lead-free zinc oxide and lithopone fell 31 and 19 percent, respectively, from 1937. Contrary to the trend for other pigments the average values received by producers for zinc oxide and leaded zinc oxide increased in 1938 and were responsible for the smaller decline in total value for zinc pigments than that for lead pigments, despite a larger decrease in total quantity. Sales of leaded zinc oxide in 1938 were 44 percent higher than the average annual sales in 1925–29, while those for zinc oxide and lithopone were lower by 49 and 29 percent, respectively.

Digitized by Google

Large amounts of basic lead sulfate are now used in making leaded zinc oxide. Such quantities are included as part of the leaded zinc oxide total and, to avoid duplication, are not shown as basic lead sulfate.

Complete data covering the production of zinc chloride in recent years are not available owing to the refusal of one large producer to supply an accurate report.

Sales of zinc sulfate declined 26 percent from the high record established in 1937.

## CONSUMPTION BY INDUSTRIES

*White lead.*—Sales of white lead (dry and in oil) withstood unsatisfactory marketing conditions in 1938 better than other lead and zinc pigments. The total increased 1 percent compared with declines of 5 to 31 percent in the other principal pigments. About 95 percent of the white lead made is used in the manufacture of paint. The quantity consumed for this purpose in 1938 was relatively unchanged from 1937 but amounted to only 69 percent of the tonnage so used in 1929. Early in 1939 the Lead Industries Association announced a 3-year promotion campaign designed to increase the use of white lead paint. The campaign will include identification of white lead as "the most durable." Increased consumption of white lead paint would benefit the lead industry more than increases in almost any other use, for metal so used is dissipated, whereas that used in storage batteries, cable coverings, building, and for similar purposes returns to the market as scrap.

*Distribution of white lead (dry and in oil) sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Paint | 75,008 | 91,297 | 113,363 | 93,580 | 93,788 |
| Ceramics | 1,434 | 1,834 | 2,653 | 2,506 | 1,918 |
| Other | 2,292 | 3,700 | 2,391 | 2,127 | 3,277 |
| | 78,734 | 96,831 | 118,407 | 98,213 | 98,983 |

*Basic lead sulfate.*—The outstanding use of basic lead sulfate is in the manufacture of paint, and 87 percent of the amount reported for 1938 was sold for that purpose. Increasing quantities of this pigment are being used annually in making leaded zinc oxide. The amounts so used are included in the totals for leaded zinc oxide and excluded from the totals for basic lead sulfate to avoid duplication in the reporting of lead tonnages. In 1938, 7,000 tons of basic lead sulfate were used in making leaded zinc oxide compared with 5,500 tons in 1937.

*Distribution of basic lead sulfate sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Paints | 6,611 | 7,770 | 8,124 | 8,255 | 5,024 |
| Rubber | 93 | 155 | 126 | 213 | 91 |
| Storage batteries | 139 | ---- | 28 | 6 | 3 |
| Other | 224 | 374 | 144 | 148 | 683 |
| | 7,067 | 8,299 | 8,422 | 8,622 | 5,801 |

*Litharge.*—Although total sales of litharge fell 18 percent in 1938 the quantity sold for use in the manufacture of storage batteries—the principal use of this pigment—was maintained at the 1937 rate. All other uses except linoleum showed more than the average drop from 1937. Less lead oxide was used in making batteries, however, for the output of black oxide or suboxide of lead by battery manufacturers declined from the peak output of 42,000 tons in 1937 to 32,000 tons in 1938. The figures on black oxide are not included in Bureau of Mines totals for litharge. Since 1931 insecticides have been the second most important use of litharge. In 1938 sales for this purpose declined 36 percent from the high record established in 1937. Information received in 1939 made it necessary to revise the figures covering distribution of sales of litharge by uses for 1934–37, as will be noted from a comparison of the following table and that on this subject on page 159 of Minerals Yearbook, 1938. Sales of litharge for use in chrome pigments for that period have been overstated, and those for varnish and paints have been understated.

*Distribution of litharge sales, 1934–38, by industries, in short tons*

*Red lead.*—The principal use of red lead is in the manufacture of storage batteries, and the quantity employed for that purpose declined only 6 percent in 1938 compared with a drop of 11 percent in total red lead sales. A new process for the manufacture of this product was reported in a lecture at Birmingham, England, and is described briefly in the Oil, Paint, and Drug Reporter.[3] The process consists of direct vaporization of pure lead in an electric arc furnace and passing of the lead vapor into a precipitating chamber where it mixes with pure oxygen and, with temperature, pressure, and feeds under control, produces the new-type red lead. Higher corrosion-resisting properties and almost twice the covering qualities of standard red lead are claimed for the new commodity. A plant that will use this process was erected at Beeston, England.

*Distribution of red lead sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Storage batteries | 15,987 | 17,657 | 20,323 | 20,275 | 19,057 |
| Paints | 8,766 | 8,721 | 11,786 | 10,440 | 8,698 |
| Ceramics | 595 | 867 | 807 | 854 | 655 |
| Other | 1,395 | 1,531 | 1,980 | 2,362 | 1,773 |
| | 26,743 | 28,776 | 34,896 | 33,931 | 30,183 |

*Orange mineral.*—Sales of orange mineral fell 38 percent in 1938. The principal use shifted back to color pigments again after ink manufacture had ranked first for the 1 year—1937.

*Distribution of orange mineral sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Ink manufacture | 24 | 85 | 71 | 76 | 20 |
| Color pigments | 68 | 125 | 77 | 51 | 94 |
| Other | 142 | 42 | 100 | 79 | 13 |
| | 234 | 252 | 248 | 206 | 127 |

*Zinc oxide.*—The principal use of zinc oxide is in the manufacture of rubber, and sales for that purpose declined in the same proportion as total sales—31 percent. Sales for use in paints fell only 25 percent; but those for floor coverings and textiles, which gained against the trend in 1937, had the sharpest drop of all—66 percent. Ceramics withstood the downtrend well, declining only 6 percent. Of the production for 1938, 62 percent was made by the American process and 38 percent by the French process compared with 69 and 31 percent, respectively, in 1937. The ratio of American to French process zinc oxide in 1937 is believed to have been unduly high, owing to the tight situation regarding supplies of metal during part of that year, and the ratio in 1938 continues above that for other recent years. The proportion of French-process oxide made from scrap zinc increased again, rising from 25 percent in 1937 to 32 percent in 1938. A large amount of zinc oxide is used in the manufacture of leaded zinc oxide. This tonnage is included in the totals for leaded zinc oxide and is excluded

[3] Oil, Paint, and Drug Reporter, New-Process Red Lead: Vol. 133, No. 24, June 13, 1938, p. 61.

Digitized by Google

from zinc oxide totals to avoid duplication in the reporting of zinc tonnages. Zinc oxide uses in paint were discussed by Nelson.[4]

*Distribution of zinc oxide sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Rubber | 50,145 | 57,734 | 72,885 | 67,061 | 46,266 |
| Paints | 23,741 | 25,289 | 33,149 | 27,987 | 20,884 |
| Ceramics | 2,963 | 4,028 | 6,102 | 5,216 | 4,908 |
| Floor coverings and textiles | 4,781 | 7,179 | 7,178 | 9,019 | 3,030 |
| Other | 5,458 | 5,467 | 7,486 | 5,369 | 4,041 |
| | 87,088 | 99,697 | 126,800 | 114,652 | 79,129 |

*Leaded zinc oxide.*—The manufacture of paint uses virtually all the leaded zinc oxide made, 98 or more percent being consumed regularly for this purpose. This pigment has become increasingly popular in recent years, and sales thereof were at a record high level in 1936 and 1937. In 1938 sales declined 5 percent, a smaller decline than was indicated for any other pigment except white lead. The total for 1938 includes about 7,000 tons of basic lead sulfate used to increase the lead content of this product; this tonnage is excluded from basic lead sulfate totals to avoid duplication in reporting metal tonnages. Leaded zinc oxide was discussed by Eide and Depew.[5]

*Distribution of leaded zinc oxide sales, 1934–38, by industries, in short tons*

| Industry | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Paints | 20,376 | 29,632 | 40,156 | 39,584 | 37,348 |
| Rubber | 28 | 36 | 32 | 97 | ---------- |
| Other | 102 | 308 | 324 | 662 | 868 |
| | 20,506 | 29,976 | 40,512 | 40,343 | 38,216 |

*Lithopone.*—Sales of lithopone in 1938 dropped 19 percent from those in 1937. The percentage of the total used in the manufacture of paint has increased in recent years; it was 73 percent in 1929, 79 in 1937, and 81 in 1938. Lithopone statistics are given on the basis of the regular lithopone content of high-strength lithopone plus normal lithopone sold as such. Prior to 1936 the figures were on the basis of standard-strength plus high-strength product. Data showing the increased use of high-strength lithopone are not available. Use of lithopone by the floor coverings and textiles and by the rubber industries fell considerably more in proportion than the total. On the basis of somewhat incomplete information, separation of the amounts shown in the following table for floor coverings and textiles indicates that 10,800 tons were for linoleum and felt-base floor coverings and the remainder for coated fabrics and textiles (oilcloth, shade cloth, artificial leather, etc.). "Other uses" in 1938 included 1,352 tons used for paper and 477 tons for printing ink.

| | 145,565 | 159,486 | 158,319 | 154,771 | 125,746 |

The use of ordinary-strength lithopone in the manufacture of titanated lithopone, which usually contains about 15 percent $TiO_2$, has increased sharply since the output of this product began. There was a drop in 1938, however, when 17,000 tons were used for this purpose compared with 19,400 tons in 1937.

*Zinc sulfide.*—Production of zinc sulfide was reported by four plants in 1938; but owing to the fact that one producer represents such a large part of the total, the Bureau of Mines cannot publish representative statistics. Most of the zinc sulfide is mixed with regular lithopone to make high-strength lithopone.

*Zinc chloride.*—The Bureau of Mines cannot report zinc chloride production because of the refusal of one of the large producers to supply reliable data.

Complete data on sales of zinc chloride are not available, but returns from producers representing two-thirds or more of the output indicate the following distribution of sales by uses in 1938:

| | Percent | | Percent |
|---|---|---|---|
| Soldering flux | 40 | Oil refining | 4 |
| Wood preserving | 24 | Others | 7 |
| Dry-cell batteries | 14 | | |
| Vulcanized fiber | 11 | | 100 |

*Zinc sulfate.*—The trend of sales of zinc sulfate was upward from 1932 to 1937, and a new high record rate was established in 1937. In 1938 sales fell 26 percent from those in 1937. Efforts to obtain figures covering the distribution of sales of zinc sulfate were more successful in 1938 than in previous years. Of the total sales (7,757 tons), 2,851 tons were reported as sold to the rayon industry, 1,664 tons for agricultural purposes, 947 tons for chemicals, 656 tons to paint and varnish manufacturers, 285 tons for glue manufacture, 284 tons to electrogalvanizers, and 59 tons to printers and dyers of textiles; 948 tons were undistributed.

## RAW MATERIALS USED IN THE MANUFACTURE OF LEAD AND ZINC PIGMENTS AND SALTS

Lead pigments and zinc pigments and salts are manufactured from a variety of materials, including ore, refined metal, and such miscellaneous secondary materials as scrap and waste from various industrial processes. In 1938, 93 percent of the lead in lead pigments was derived from pig lead and 7 percent from ore. The proportions for zinc pigments in 1938 were 67 percent from ore, 15 percent from slab zinc, and 18 percent from secondary materials.

| | 222,451 | [2] 156,637 | 174,853 | 102,646 |

[1] Includes also lead recovered in zinc oxide and leaded zinc oxide.
[2] Revised figures.
[3] Zinc ashes, skimmings, drosses, and old metal.

The following tables give the source of the metal used in the manufacture of each pigment and salt. Pig lead is employed exclusively, either directly or indirectly, in the manufacture of white lead, litharge, red lead, and orange mineral, as well as in the manufacture of basic lead sulfate. Zinc oxide is the only pigment in which considerable slab zinc is used. Ore is employed in the manufacture of zinc oxide, leaded zinc oxide, lithopone, zinc sulfate, and basic lead sulfate. A substantial proportion of the zinc in lithopone and zinc chloride made in the United States is derived from secondary material. There has been a decided increase in the quantity of secondary zinc consumed in the manufacture of zinc oxide since 1933. This material has displaced slab zinc in the manufacture of French-process oxide.

## PRODUCERS AND PLANTS

The following companies sold or used lead and zinc pigments and zinc salts of their own production in 1938:

| | |
|---|---|
| White lead: | |
| The Eagle-Picher Lead Co | Cincinnati, Ohio. |
| Euston Lead Co | Scranton, Pa. |
| W. P. Fuller & Co | South San Francisco, Calif. |
| International Smelting and Refining Co. (electrolytic process). | East Chicago, Ind. |
| John T. Lewis & Bros. Co | Philadelphia, Pa. |
| National Lead Co | Melrose, Calif. |
| Do. (2 plants) | Chicago, Ill. |
| Do | St. Louis, Mo. |
| Do | Perth Amboy, N. J. |
| Do | Brooklyn, N. Y. |
| Do | Port Richmond, N. Y. |
| The Sherwin-Williams Co | Chicago, Ill. |
| Basic lead sulfate, or sublimed lead: | |
| The Eagle-Picher Mining & Smelting Co | Galena, Kans. |
| National Lead Co | St. Louis, Mo. |
| Red lead, orange mineral, and litharge: | |
| The Andrews Lead Co., Inc | Long Island City, N. Y. |
| E. I. du Pont de Nemours and Co | East Chicago, Ind. |
| The Eagle-Picher Lead Co | Joplin, Mo. |
| Do | Newark, N. J. |
| The Eagle-Picher Mining & Smelting Co | Galena, Kans. |
| W. P. Fuller & Co | South San Francisco, Calif. |
| Hammond Lead Products, Inc | Hammond, Ind. |
| Morris P. Kirk & Son | Los Angeles, Calif. |
| John T. Lewis & Bros. Co | Philadelphia, Pa. |
| Metals Refining Division of the Gidden Co. | Hammond, Ind. |
| National Lead Co | Melrose, Calif. |
| Do | Chicago, Ill. |
| Do | St. Louis, Mo. |
| Do | Brooklyn, N. Y. |
| Do | Charleston, W. Va. |
| The Sherwin-Williams Co | Chicago, Ill. |
| United Color & Pigment Co | Newark, N. J. |
| Zinc oxide and leaded zinc oxide: | |
| American Zinc Co. of Illinois | Hillsboro, Ill. |
| American Zinc Oxide Co | Columbus, Ohio. |
| The Eagle-Picher Lead Co | Hillsboro, Ill. |
| International Smelting and Refining Co. (French process). | East Chicago, Ind. |
| Do | Akron, Ohio. |
| Morris P. Kirk & Son | Los Angeles, Calif. |
| Monsanto Chemical Co | St. Louis, Mo. |
| The New Jersey Zinc Co. (of Pennsylvania) | Palmerton, Pa. |
| Do. (French process) | Freemansburg, Pa. |
| The Ozark Smelting & Mining Division of The Sherwin-Williams Co. | Coffeyville, Kans. |
| Röhm & Haas Co | Bristol, Pa. |
| St. Joseph Lead Co. of Pennsylvania | Monaca, Pa. |
| Superior Zinc Corp | Bristol, Pa. |
| Lithopone: | |
| The Chemical & Pigment Co | Oakland, Calif. |
| Do | Collinsville, Ill. |
| Do | St. Helena, Md. |
| E. I. du Pont de Nemours and Co | Newport, Del. |
| Do | Newark, N. J. |

| E. I. du Pont de Nemours and Co | East Chicago, Ind. |
| Do | Cleveland, Ohio. |
| Do | Weirton, W. Va. |
| General Chemical Co | Chicago, Ill. |
| Great Western Electro-Chemical Co | Pittsburg, Calif. |
| Jordan Co | Chicago, Ill. |
| Morris P. Kirk & Son | Los Angeles, Calif. |
| Mallinckrodt Chemical Works | St. Louis, Mo. |
| Merrimac Division of Monsanto Chemical Co. | Everett, Mass. |
| The Ozark Smelting & Mining Division of The Sherwin-Williams Co | Coffeyville, Kans. |
| Pacific Smelting Inc., Ltd | Torrance, Calif. |
| Röhm & Haas Co | Bridesburg, Pa. |
| The Ruby Chemical Co | Columbus, Ohio. |
| Virginia Smelting Co | West Norfolk, Va. |

## PRICES

The total values reported by producers for lead and zinc pigments and zinc salts are given in the tables in the first part of this report. The average values received for important lead pigments dropped from 11 to 15 percent, while those for zinc pigments were relatively stationary or increased up to 14 percent. The range of market quotations, as reported by the Oil, Paint, and Drug Reporter, appears in the following table. The prices for lead pigments in general followed that for pig lead, declining to the low point of the year in the middle of the year and rising in the third quarter. Quoted prices for lithopone, zinc chloride, and zinc sulfate were relatively unchanged from those for 1937, while prices for zinc oxide in general remained throughout the year at the best levels reached in 1937.

| French process, white seal, barrels, carlots | 6.50–10.63 | 6.50– 6.75 | 7.00– 8.75 | 8.75 |
| Lithopone, domestic, 5-ton lots, bags | 4.50 | 4.25– 4.50 | 4.25– 4.63 | 4.38– 4.63 |
| Zinc sulfide, less than carlots, bags, barrels | 10.50–11.75 | 9.25–11.75 | 9.25– 9.50 | 8.63– 9.50 |
| Zinc chloride, works: | | | | |
| Solution, tanks | 2.00 | 2.00 | 2.00– 2.25 | 2.25 |
| Fused, drums | 4.50– 5.75 | 4.25– 5.75 | 4.25– 5.75 | 4.25– 5.75 |
| Zinc sulfate, crystals, barrels | 2.65– 2.80 | 2.65– 3.95 | 2.80– 4.05 | 2.65– 4.05 |

## FOREIGN TRADE [6]

Imports of lead and zinc pigments decreased 32 percent and exports 29 percent in value in 1938. The excess value of exports over imports amounted to $554,000; it was only slightly more than one-fifth of the annual average for 1925–29. The value of imports of lead and zinc salts was less than one-half that in 1937, while the value of exports of lead arsenate, the only salt separately recorded, increased.

The following table shows the values of various pigments and salts imported and exported in 1937 and 1938.

*Value of foreign trade of the United States in lead and zinc pigments and salts, 1937–38*

| | 1937 | | 1938 | |
|---|---|---|---|---|
| | Imports | Exports | Imports | Exports |
| Lead pigments: | | | | |
| White lead | $6,677 | $207,381 | $3,979 | $190,745 |
| Red lead | 285 | 158,923 | 79 | 115,348 |
| Litharge | 31 | 220,134 | 123 | 203,610 |
| Orange mineral | 928 | (1) | 271 | (1) |

[6] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Digitized by Google

*Lead pigments and salts.*—Imports of these commodities are insignificant. The most important item is the group of lead compounds, which include lead acetate, lead nitrate, and others, but imports of these compounds fell from 213 tons in 1937 to 85 in 1938. Imports of suboxide of lead fell from 28 tons in 1937 to 16 in 1938.

*Lead pigments and salts imported for consumption in the United States, 1934–38, in short tons*

| Year | Basic carbonate white lead | Red lead | Litharge | Orange mineral | Lead compounds | Total value |
|---|---|---|---|---|---|---|
| 1934 | 15 | ---- | (1) | 5 | 183 | [2] $29,425 |
| 1935 | 6 | 1 | ---- | 2 | 302 | [2] 38,228 |
| 1936 | 32 | 2 | 1 | 5 | 185 | [2] 37,878 |
| 1937 | 34 | 1 | (1) | 5 | 213 | [2] 53,984 |
| 1938 | 20 | 1 | 1 | 2 | 85 | [2] 22,644 |

[1] Less than 1 ton.
[2] Includes also—1934: Lead pigments, n. s. p. f., $18 (200 pounds), sublimed lead (basic sulfate) $39 (10 pounds); 1935: Lead pigments, n. s. p. f., $478 (4,405 pounds); 1936: Lead pigments, n. s. p. f., $19 (33 pounds), sublimed lead (basic sulfate) $9 (15 pounds), and suboxide of lead, n. s. p. f., $5,264 (39,010 pounds); 1937: Lead pigments, n. s. p. f., $8 (100 pounds), sublimed lead (basic sulfate), $2 (10 pounds), and suboxide of lead, n. s. p. f., $9,396 (55,453 pounds); 1938: Lead pigments, n. s. p. f., $198 (2,330 pounds), and suboxide of lead, n. s. p. f., $5,335 (31,834 pounds).

The principal exports are white lead and litharge, and these two items increased in 1938, although not significantly. Exports of red lead and lead arsenate declined in 1938. Exports of white lead, red lead, and litharge comprised less than 2 percent of domestic production of these pigments.

White lead was exported principally to the Philippine Islands, Netherlands, and Canada, while red lead and litharge were exported mainly to Canada, the Philippines, and Netherland West Indies.

*Lead pigments and salts exported from the United States, 1934–38, in short tons*

*Zinc pigments and salts.*—Imports of all items shown under this heading declined in 1938. Lithopone ranks as the most important zinc pigment imported, although imports of this commodity represented only 3 percent of domestic sales in 1938. Imports of zinc oxide (dry and in oil) totaled 645 tons, a decline from 775 tons in 1937

*Zinc pigments and salts imported for consumption in the United States, 1934–38, in short tons*

| Year | Zinc oxide | | Lithopone | Zinc sulfide | Zinc chloride | Zinc sulfate | Total value |
|---|---|---|---|---|---|---|---|
| | Dry | In oil | | | | | |
| 1934 | 1,204 | 64 | 3,927 | 12 | 382 | 140 | $404,25 |
| 1935 | 1,932 | 59 | 4,603 | 16 | 564 | 135 | 508,47 |
| 1936 | 694 | 96 | 4,781 | 30 | 520 | 385 | 425,49 |
| 1937 | 680 | 95 | 5,601 | 113 | 667 | 593 | 488,11 |
| 1938 | 579 | 66 | 3,932 | 12 | 272 | 392 | 321,43 |

Exports of zinc oxide made a notable gain in 1937 but in 1938 returned to 13 percent below the 1936 level. Shipments of lithopone abroad declined sharply in 1938 and were the smallest recorded since 1933. As usual, Canada was the principal destination of exports of zinc oxide and lithopone, 514 and 1,219 tons, respectively, of the totals of 1,163 and 1,734 tons going to that country in 1938.

*Zinc pigments and salts [1] exported from the United States, 1934–38, in short tons*

| Year | Zinc oxide | Lithopone | Total value | Year | Zinc oxide | Lithopone | Total value |
|---|---|---|---|---|---|---|---|
| 1934 | 1,155 | 2,401 | $395,189 | 1937 | 2,953 | 2,671 | $609,95 |
| 1935 | 1,140 | 2,372 | 392,368 | 1938 | 1,163 | 1,734 | 339,41 |
| 1936 | 1,330 | 2,538 | 419,987 | | | | |

# GOLD, SILVER, COPPER, AND LEAD IN ALASKA

(MINE REPORT)

By CHAS. W. HENDERSON

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 185 | Markets and metallurgy | 187 |
| Calculation of value of metal production | 185 | Review by regions | 188 |

Alaska mines yielded gold, silver, copper, and lead valued in terms of recovered metals at $26,527,315 in 1938 compared with $26,652,698 in 1937, a decrease of less than 0.5 percent. Maintaining a value of gross production in 1938 comparable with that in 1937 was due directly to a 9-percent increase in value of placer gold output; gold production from lode mines remained virtually constant through the 2 years. The value of the copper output decreased 32 percent from 1937, owing to exhaustion of the ore bodies of the two largest copper producers and to the lower average price for refined copper.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

The following tables show the mine production of gold, silver, copper, and lead in Alaska in 1934–38 and 1880–1938; the output of gold, silver, and lead from amalgamation and cyanidation mills (with or without concentration equipment) in 1938, by regions; and the output of gold and silver in 1938, by types of operation. The Bureau of Mines is not at liberty to publish separately the quantity of ore treated at straight concentration mills and that shipped crude to smelters.

| Total, 1937 | 4,556,978 | 201,562.77 | 37,227 | 3,446 | 29,771.42 | 100,140 | (1) | 1,641,441 |

[1] Bureau of Mines not at liberty to publish details of copper production.

Digitized by Google

*Gold.*—Gold contributed 88 percent of the total value of the gold, silver, copper, and lead produced in Alaska in 1938, an increase from 82 percent in 1937. Floating connected-bucket dredges, of which there were 44 in operation compared with 41 in 1937, contributed the larger part of the increase in gold output; the gold recovered was 9 percent above that in 1937. Increased use of draglines, slack-line scrapers, bulldozers, and floating washing plants in the Seward Peninsula, Yukon Basin, Kuskokwim, and Cook Inlet regions caused the gold output from other types of placer operations (excluding the floating connected-bucket type) to show the largest relative increase (10 percent) but a net increase smaller than that of the dredges. In 1938 there were 99 operators using such mechanical equipment—47 dragline and dry-land dredges, 13 slack-line drag scrapers, 15 caterpillar bulldozers, and 24 using a combination of bulldozers and hydraulic. Production from lode mines was slightly (less than 0.5 percent) lower than in 1937. Nine more lode mines were in active operation, but their added production did not suffice to offset the decline in production at the two largest lode mines in Alaska during 1938.

*Silver.*—The output of recoverable silver in Alaska decreased 14,487 fine ounces from 1937 to 1938. As over 50 percent of the total silver in both years was obtained as a byproduct of copper production, this decrease can be attributed directly to the decline in copper output. No mines in Alaska yielded silver as their principal product.

*Copper.*—The output of recoverable copper in Alaska in 1938 decreased 16 percent from 1937. This decline can be attributed directly to exhaustion of the ore bodies at Kennecott, for many years the largest copper mine in Alaska. The lowering of the average price paid for refined copper did not tend to lower the copper output from the many operations that produced copper as a byproduct of their gold production only.

*Lead.*—Recoverable lead production in Alaska in 1938 increased 21 percent in quantity over 1937 but decreased 6 percent in total value. The value of the lead produced was less than 1 percent of the total value of the gold, silver, copper, and lead. The bulk of the lead is recovered from lead concentrates produced by the Alaska Juneau Gold Mining Co. in the Southeastern Alaska region.

## MARKETS AND METALLURGY

There are no smelters or refineries in Alaska. The bulk of the gold produced is in the form of bullion from placer and lode operations, which is sent finally to the Seattle Assay Office or the San Francisco Mint. Over half of the silver and all the copper and lead produced are obtained from high-grade ore and concentrates shipped to the Tacoma (Wash.) and Selby (Calif.) smelters.

There were 37 mines in Alaska in 1938 equipped with amalgamation or cyanidation plants—ranging in daily capacity from 1 ton to 12,000 tons—that were in continuous operation throughout the year. One mine was equipped with a flotation plant milling copper-palladium ore in the Southeastern Alaska region; one mine was equipped with a flotation- and table-concentration mill for handling copper-silver ore in the Copper River region; and 23 mines were equipped with amalgamation and cyanidation plants (chiefly amalgamation) that ran intermittently during the year. The copper concentrates shipped to

Digitized by Google

Tacoma averaged approximately 50 percent in copper content. Gold concentrates from straight concentration mills averaged over 16 ounces of gold and over 21 ounces of silver to the ton.

The gold-silver bullion is sold either direct to the Seattle Assay Office or San Francisco Mint or, first, to one of the many gold bullion buyers in the larger centers of Alaska. These purchasers of gold-silver bullion send it direct to the mint or cast it in bars for shipping; in many cases they act merely as agents for many lode and placer operators. Among the largest purchasers of gold-silver bullion during 1938 were: The First National Bank of Fairbanks, Fairbanks; the Miners and Merchants Bank of Iditarod, Flat; the Miners and Merchants Bank of Alaska, Nome; and the Northern Commercial Co. and the Seattle First National Bank, Seattle (Wash.).

The United States Assay Office, Seattle, Wash., reports the following receipts from Alaska in 1938.

*Bullion of Alaskan origin deposited at United States Assay Office, Seattle, Wash., during year ended Dec. 31, 1938, in fine ounces*

| District | Gold | Silver |
|---|---|---|
| Circle | 16,086.117 | 1,428.22 |
| Cook Inlet | 48,771.753 | 5,001.04 |
| Copper River | 5,758.978 | 1,143.74 |
| Eagle | 5,410.448 | 1,038.22 |
| Iditarod | 49,263.807 | 7,447.20 |
| Koyukuk | 1,664.992 | 119.37 |
| Kuskokwim | 18,063.324 | 1,848.46 |
| Nome | 105,918.145 | 11,995.85 |
| Southeastern Alaska | 141,393.724 | 28,598.44 |
| Tanana [1] | 211,271.634 | 35,038.11 |
| | 603,602.922 | 93,658.65 |

[1] Includes mainly Bonnifield, Fairbanks, Hot Springs, Kantishna, and Tolovana districts in the Yukon Basin region.

## REVIEW BY REGIONS

*Cook Inlet-Susitna region.*—The Cook Inlet-Susitna region, comprising the Prince William Sound, Valdez Creek, Willow Creek, and Yentna-Cache Creek districts, produced 14 percent of the total lode gold output in Alaska during 1938. The bulk of the metal from lodes in this region came from mines in the Willow Creek district.

The Alaska-Pacific Consolidated Mining Co. at Wasilla, operating the Independence and Martin mines, was the largest producer. The bulk of the gold from this operation was in the form of bullion shipped to the Seattle Assay Office. Some high-grade concentrates were shipped to Tacoma during the year.

Willow Creek Mines, Inc., operating the Luckyshot and War Baby mines in the Willow Creek district, was taken over by the Conwest Exploration Co. April 20, 1938, but the latter company did not begin active operations until June 20; the old name, Willow Creek Mines, Inc., was not dropped. The Conwest Exploration Co. milled 2,356 tons of gold ore during the latter part of 1938; the heads averaged 0.75 ounce of gold to the ton. The mill, of 40 tons daily capacity, concentrates crude ore by means of flotation and jigs; the flotation concentrate is cyanided and the jig concentrate is amalgamated.

The Cliff Gold Mining Co., Inc., operating the Cliff mine in the Prince William Sound district and equipped with a 30-ton amalgamation-concentration mill, handled crude ore averaging over $50 to

Digitized by Google

the ton in recoverable gold. Bullion was shipped to the Seattle Assay Office through the First Bank of Valdez, and concentrates were shipped to the Tacoma smelter.

Rapp & Till, re-treating impounded tailings from the Gold Bullion mine property of Willow Creek Mines, Inc., made a creditable production.

Other operators making notable production were: The Fern Gold Leasing Co., operating in the Willow Creek district, and the Gold Cord Development Co., operating the Gold Cord mine, also in the Willow Creek district.

There were no floating connected-bucket dredges in the Cook Inlet-Susitna region in 1938. Several producers using hydraulic giants or dragline excavators and portable washing plants made a sizable production. The bulk of the gold from placer operations came from mines in the Yentna-Cache Creek district. Among the leading producers using hydraulic giants, dragline excavators, caterpillar bulldozers, and auxiliary washing plants were: Spokane Peters Creek, Inc., operating on bench gravels on Peters Creek; the Cache Creek Mining Co., operating on Cache Creek; and the Dutch Creek Mining Co., operating on Dutch Creek.

*Copper River region.*—The Copper River region, comprising the Chistochina, Nabesna, Nelchina, and Nizina districts, produced over half of the recoverable silver output and the bulk of the recoverable copper output of Alaska during 1938. The largest producers of copper and silver in this region were the Kennecott Copper Corporation and its subsidiary, the Mother Lode Coalition Mines Co., operating properties at Kennecott. The metal output of these mines was contained in high-grade copper ore and high-grade copper concentrates, from the 900- to 1,100-ton concentrating mill operated by the Kennecott Copper Corporation, shipped to Tacoma; no custom ores were handled. The mines of the Kennecott Copper Corporation and the Mother Lode Coalition Mines Co. were abandoned permanently during the latter part of 1938 owing to exhaustion of the ore bodies.

The Twentieth Annual Report of the Mother Lode Coalition Mines Co. for the year ended December 31, 1938 (dated April 4, 1939), says—

In the midyear statement you were advised that operations at the mine were terminated on July 31, 1938, because of the exhaustion of the ore body. During the 7-month period of operations 16,082 tons of ore containing 2,426 tons of recoverable copper were mined. These tonnages exceed the amount estimated in the last annual report to be contained in the ore reserves on January 1, 1938, by 4,682 tons of ore containing 1,220 tons of recoverable copper.

The unsold copper on hand January 1, 1938, and that mined during the 7-month period of operations, an aggregate of 7,120 tons, was sold before the close of the year.

The net income of the company, after inclusion of miscellaneous other income and the deduction of all costs including taxes, but before depletion, was $508,766.75, which is equal to approximately 20 cents per share on the outstanding capital stock of the company.

In the annual reports for 1936 and 1937 special reference was made to the unsatisfactory outcome of the development and prospecting work which had been carried on by the company. It had also been indicated in previous reports that the results of that work had been most unfavorable and disappointing and that no new ore bodies of commercial grade had been disclosed. Similarly, no new ore body was found during 1938. After the termination of mining operations the mine was closed down and all equipment having any net salvage value was removed from the mine and shipped out for sale. This equipment has not been sold and while the amount of salvage is not determinable at this time it will not be an important item. The 19 patented mining claims to which the company has title continue to be held.

Digitized by Google

The Twenty-fourth Annual Report of the Kennecott Copper Corporation for the year ended December 31, 1938 (dated March 21, 1939), makes the following comment on its Alaska property.

The Alaska property was operated until the latter part of October when all ore of commercial value was exhausted and the property closed down. Equipment having any net salvage value was removed and shipped out before abandonment of railroad operations. Production from this property has averaged only 525 tons copper per month since 1928 and therefore cessation of these operations will not affect earnings as this tonnage can easily be made up from other properties.

The Nabesna Mining Corporation, operating the Nabesna mine in the Nabesna mining district, produced the bulk of the output of lode gold in the Copper River region in 1938. The gold and silver recovered were contained in copper concentrates shipped to the Tacoma smelter. The Ninth Annual Report of the Nabesna Mining Corporation for the year ended December 31, 1938, says—

Comparison with last year shows that the most distinctive features of 1938 Nabesna operation have been: Increase of actual mill operating time, larger tonnage treated, better recovery, and a gross production value more than double that of any previous year's record.

The steady and the efficient working of the power plant and mill equipment with only a comparatively small amount of time needed for making repairs, general overhaul, and maintenance work made possible the increase in operating days and the larger tonnage milled.

Better recovery was made by efficient mill operation and alterations in the set-up of the flotation unit and of the reagents used. The closing down of the cyanide plant operation has also contributed to a better over-all recovery and has made possible a considerable saving in operating costs. All of these increases and improvements, together with the higher value of the ore milled, combined to give the larger gross production amount for the year.

Mining and development work were carried on continuously during the year. Work was accomplished on all levels of the mine from the 250- down to the 650-foot level. The Nugget Crosscut on the 250-foot level and the 350-foot level drift received the greater part of the development work. No new ore bodies of any importance have been found during the last few months of the year. During the year as a whole, however, mining development has shown very satisfactory results as to quantities and grade of ore developed. Especially has this been the case with the No. 49 ore body, which was found to extend for over 300 vertical feet above the 450-foot level. Ore has been mined from 53 Stope on the 550-foot level in ore that is the downward extension of the No. 45 ore body from levels above. A vein of medium-grade ore three feet wide has lately been found while extending the Nugget Crosscut farther ahead toward the main line diorite contact.

The winter production of concentrates is being stored at the mine. These will be hauled to Valdez and shipped to the smelter as soon as the road to the coast is open for traffic in the spring.

While the permanent closing of the Copper River & Northwestern railroad will shorten the season in which supplies can be freighted to Nabesna mine by about 2 months, it will otherwise cause no great inconvenience to the operation, as freight can be handled over the Valdez route at less cost than was formerly done via the railroad routing.

*Historical summary of operations of Nabesna Mining Corporation, 1930–38*

| Year | Milled (tons) | Recovered gross value | Mill heads value per ton | Ore milled gross value | Recovery (percent) | Mill operation (days) | Underground work (linear feet) | Diamond drill work (linear feet) |
|---|---|---|---|---|---|---|---|---|
| 1930 | | | | | | | 150 | |
| 1931 | 1,302 | $60,759.53 | $90.00 | $117,180.00 | 50.99 | 60 | 617 | |
| 1932 | 2,022 | 131,978.54 | 83.68 | 169,200.96 | 81.67 | 86 | 412 | |
| 1933 | 2,874 | 141,649.68 | 53.54 | 153,873.96 | 81.40 | 119 | 532 | |
| 1934 | 9,955 | 244,073.69 | 32.86 | 327,121.30 | 74.60 | 170 | 1,868 | 585 |
| 1935 | 16,443 | [1] 247,259.38 | 19.52 | 320,967.36 | 77.03 | 295 | 2,323 | 1,045 |
| 1936 | 11,653 | [1] 190,513.11 | 17.99 | 209,637.47 | 90.88 | 223.7 | 3,203 | 1,292 |
| 1937 | 16,117 | 198,249.04 | 18.00 | 290,145.97 | [2] 68.33 | 284.71 | 1,980 | 695 |
| 1938 | 18,026 | 525,689.98 | 33.65 | 606,629.79 | 86.66 | 312.75 | 2,589 | 1,840 |
| Total, 1930–38 | 78,392 | 1,740,172.95 | 28.00 | 2,194,756.81 | 79.29 | 1,551.16 | 13,674 | 5,457 |

[1] Exclusive of bullion from stacked middlings, as follows: 1935, $10,233.57; 1936, $15,934.70. [2] Over-all.

Digitized by Google

There were no floating connected-bucket dredges in the Copper River region in 1938. The output of placer gold came from several small hydraulicking, sluicing, and drift-mining operations scattered throughout the region. The larger producers were: Green Mining Associates, hydraulicking on Boulder Creek in the Nizina district; Chititu Mines, operating on Chititu Creek in the Nizina district; Ahtell Mining Co., hydraulicking on Grubstake Creek in the Chistochina district; Rex Creek Mining Co., operating on Rex Creek near McCarthy; and John Long, operating on Copper Creek about 30 miles from McCarthy.

*Kenai Peninsula region.*—The Girdwood, Moose Pass, Hope, and Nuka Bay districts, included in the Kenai Peninsula region, showed a slight increase in total gold and silver output in 1938 over 1937. The bulk of the output from lode mines consisted of bullion from amalgamation-concentration mills, sent finally to the Seattle Assay Office; some high-grade dry gold concentrates were shipped to Tacoma. The large producers from lode operations in 1938 were: The Crown Point Mining Co., operating the Crown Point mine, and Ralph Reed, leasing the Alaska Oracle mine, both in the Moose Pass-Hope district; the Nuka Alaska Mining Co., operating in the Nuka Bay district; the Crow Creek Gold Corporation, operating the Monarch mine in the Girdwood district; and the Sonny Fox Mining Co., operating the Sonny Fox mine in the Nuka Bay district.

There were no dredging operations in the Kenai Peninsula region during 1938, but the combined output of the several small hydraulicking and sluicing placer operations made a production comparable with that of the lode mines.

*Kodiak Island region.*—The output of gold and silver from the Kodiak Island region during 1938 was confined almost entirely to operation of several small placers.

*Kuskokwim region.*—The bulk of the gold and silver produced in 1938 in the Kuskokwim region, which includes the Goodnews Bay, Nixon Fork, and Tuluksak-Aniak districts, was obtained from the operations of two floating connected-bucket dredges of the New York Alaska Gold Dredging Co. and one dredge of the Bristol Bay Mining Co.; the largest part of the output from dredge operations was produced, as in 1937, by the New York Alaska Gold Dredging Co., using a 2-cubic foot and a 4-cubic foot dredge.

The Bristol Bay Mining Co., using a fuel oil-powered floating connected-bucket dredge with sixty-five 2½-cubic foot buckets, operated from September 21 to October 8, 1938, and handled approximately 22,000 cubic yards of gravel. This dredge was built during the early months of the year and was put into operation during the latter part of the open season.

The Goodnews Bay Mining Co., operating its 1-year-old floating connected-bucket dredge from May 1 to November 12, recovered nearly four times as much platinum as was obtained in 1937; over a million cubic yards of gravel were washed.

The output of gold in 1938 from placer operations in the Kuskokwim region, other than that by floating connected-bucket dredges, increased greatly. Three of the larger operators, using draglines with portable washing plants and hydraulic mining methods, handled an aggregate of 327,000 cubic yards of gravel with an average recovered gold value of 64 cents to the cubic yard washed.

Digitized by Google

Among the large operators making notable production in 1938 were: Strandberg & Sons, Inc., operating on Candle Creek in the Nixon Fork district; the Kow Kow Mining Co., operating on Kow Kow Creek in the Goodnews Bay district; and Kvamme & Co., sluicing on Canyon Creek in the Bethel precinct (Tuluksak-Aniak district).

Although production from lode mines in 1938 showed an increase over 1937, it was small compared with that from all types of placer operations. Among the most important producers—all in the Nixon Fork district—were: Mespelt & Co., operating the Nixon Fork mine; E. M. Whalen, developing and producing from the Whalen mine; and McGowan & Lind, developing and operating the McGowan-Mespelt property.

*Northwestern Alaska region.*—The area of the Kobuk River Valley covering the Kiana and Shungnak districts comprises the Northwestern Alaska region. Mining in this region during 1938 was confined almost entirely to the operation of small placer mines, and Northwestern Alaska was not a large contributor to the total metal output of Alaska.

*Seward Peninsula region.*—In the Seward Peninsula region, which covers all the area of the Seward Peninsula, floating connected-bucket dredges produced 28 percent of the total gold recovered in 1938 from this type of operation in Alaska. There were 22 dredges in operation, an increase of 2 over 1937.

The average value in recovered gold from 11 of the large operators of floating connected-bucket dredges in 1938 was 43 cents to the cubic yard of gravel washed. The length of the open dredging season was 4 to 5½ months, beginning about the middle of May and lasting, in rare instances, to the first of November. Prospecting and preparation of ground for dredging were conducted throughout most of the year.

The United States Smelting, Refining & Mining Co., operating 3 electrically powered Yuba dredges (1 with 103 9-cubic-foot buckets, 1 with 89 9-cubic-foot buckets, and 1 with 78 9-cubic-foot buckets) at Nome, was the largest producer of gold in 1938 from dredge operations in the Seward Peninsula. Active dredging started May 23 and was continued for an average of 156 days per dredge during the rest of the season, each dredge averaging over a million cubic yards of gravel washed during this period. The average grade of material was slightly lower than in 1937. Addition of a fourth dredge is contemplated as soon as ample ground can be prepared for its operation.

The Arctic Circle Exploration Co., operating two dredges in the Fairhaven district during 1938, handled approximately 499,000 cubic yards of gravel averaging 69 cents in value of recovered gold to the cubic yard washed. This company, using two dredges (each equipped with 70 4-cubic-foot buckets), operated for a total of 220 dredge days. A hydraulic plant handling 104,300 cubic yards was in operation 145 days; the average grade of gravel handled was 90 cents in recovered gold value to the cubic yard.

The Bartholomae Oil Corporation and N. B. Tweet & Sons, operating dredges equipped with 31 2¾-cubic-foot buckets and 29 2-cubic-foot buckets, respectively, in the Port Clarence district washed 175,370 cubic yards of gravel in 1938 averaging 53 cents in recovered gold value to the cubic yard. The Bartholomae Oil Corporation

Digitized by Google

started operations June 15 and N. B. Tweet & Sons July 15, both ending the season about the middle of October.

Other large producers using floating connected-bucket dredges in 1938 were: The Council Dredging Co., operating in the Council district; the Fox Bar Dredging Co. and the Kougarok Consolidated Placers, operating in the Kougarok district; the Alaska Sunset Mines Corporation, operating in the Nome district; and the Ungalik Syndicate, operating in the Saint Michael district.

Six operators—three in the Kougarok district, one in the Koyukuk district, one in the Nome district, and one in the Fairhaven district—using hydraulic, bulldozing, dragline, and drift mining methods, handled 97,600 cubic yards of gravel in 1938 averaging 91 cents in value of recovered gold to the cubic yard; the average period of operation was May 15 to October 12. The increased use of dragline excavators, slack-line scrapers, and caterpillar bulldozers and the use of portable washing plants have displaced to some extentthe use of hydraulic mining methods in the Seward Peninsula region.

*Southeastern Alaska region.*—Southeastern Alaska, comprising the Chichagof Island, Hyder, Juneau, Ketchikan, and Windham Bay districts, was the most productive lode mining region in Alaska in 1938; it yielded 74 percent of the total lode gold output. There were 17 active or developing mines in operation, but the bulk of the lode production of gold, silver, and lead came from the mining operations of the Alaska Juneau Gold Mining Co. The Twenty-fourth Annual Report of this company for the year ended December 31, 1938 (dated February 28, 1939), says—

> The operating profit, before deductions for depreciation and depletion, of $2,043,059.56 for 1938 was less than that for the preceding year by $372,059.13. This reduction is the product of a small increase in operating costs, a small decrease in yield, and an increase in tons trammed. A small variation in costs and in recovery applied to the total tons for a year amounts to a substantial figure, but these small variations can neither be foreseen nor controlled.
>
> The figures included in Superintendent Metzgar's report, attached hereto, show a gradual increase in production from the Perseverance area, and a gradual decrease in production from the South ore body. This ore body, which has been the chief source of total production for many years, will be less productive hereafter, and an increase in production from the Perseverance area will, in the future, make up for the reduced South ore body output. During the year considerable prospecting was done below the 1,000-ft. level of the North ore body and in that particular portion prospected the bottom of the ore seemed to be definitely indicated at about the 1,200-ft. level. This prospecting work, however, is not yet completed for the entire area of the North ore body.
>
> Development work and stope preparation were continued during the year at about the same rate as in the year 1937. The total tons trammed in the year 1938 was 4,663,880, of which 1,619,570 or 34.73 percent came from the Perseverance section.
>
> In the Perseverance section the total footage of development and preparatory work was 18,409 linear feet of development work and 11,490 square feet of stope cutout which is the equivalent of the work done the previous year; in addition, a large amount of work was done in repairing the shaft and cleaning out and restoring old levels to use. We are now well established in this section and it is a regular and important part of the mine.
>
> The work begun last year on levels Nos. 11, 12 and 13 from the No. 53 winze was continued and ventilating raises from these levels to the levels above were driven.
>
> A series of raises driven from level to level in the western end of the 53 area gives ventilation through to the main level above.
>
> During the year 590,250 pounds of powder were used in blasting powder drifts, or 0.13 pound per ton trammed. The total powder consumption for mining was 0.36 pound per ton trammed as against 0.40 pound in 1937, and 0.31 pound in 1936.

Digitized by Google

*Mill.*—The installation of classifying cones and thickeners, mentioned in last year's report, was continued, and each section of the mill now has classifying and thickening. Additional flotation equipment was installed and now the slimes from all sections of the mill are treated by flotation. At the end of the year 2,000 tons of slimes per day were being treated. During the year 450,020 tons of slimes and 180,230 tons of reground middlings were treated in the flotation units.

Experimental work to see what further values may be recovered from the table tailings by flotation at a profit are being continued and a large capacity machine of special design has been ordered.

The fine tailings pumping plant installed in 1937 worked satisfactorily during the year. The increased tonnage handled by the mill worked the original six pumps installed to capacity so one additional pump was installed to take care of time out for repairs.

*Labor.*—The supply of labor was abundant throughout the year, although there was not an overabundance of skilled miners. The labor turnover was small.

Adjustments made during the last months of the year in preparation for conformance with the Wage-Hour Law resulted in an increase of the average wage per day from $6.42 in 1937 to $6.55 in 1938. The over-all cost per man per day this year was $11.22 as against $10.95 in 1937.

*Power plants.*—The regular volume of maintenance work on plants and transmission lines was done. In addition considerable work was done preparatory to rebuilding some of the older portions of the power transmission lines. One section of the Annex Creek line on the mountain will be moved to a location more removed from snowslides.

A power line through Sheep Creek tunnel to Perseverance shaft was completed and transformers were installed. A compressor for installation in the underground station prepared at Perseverance shaft last year has been ordered. This will take care of any additional demand for compressed air in the Perseverance section and make for flexibility of operation.

While there were no specific items of improvement this year that were as large as last the expenditures for maintenance and improvement continued large.

*Gold content of ore from Alaska Juneau mine, 1934–38, and total, 1893–1938*

| Year | Rock to mill from mine (tons) | | Gold (ounce) | | | | |
|---|---|---|---|---|---|---|---|
| | | | Recovery per ton fine-milled | | Losses per ton of tailings | | Content of rock from mine to mill |
| | Ore fine-milled | Coarse tailings rejected | In bullion | In galena concentrates | Fine | Coarse | |

The Hirst-Chichagof Mining Co., operating the Hirst-Chichagof mine in the Chichagof Island district, was the second-largest producer of gold in the Southeastern Alaska region in 1938 and shipped the bulk of the dry gold concentrates from this region to Tacoma.

The Alaska Gold & Metals Co., operating in the Ketchikan district in 1938, produced, in connection with its gold and palladium output, the bulk of the copper produced in Southeastern Alaska.

Other producers making a creditable output in 1938 were the Chichagof Mining Co., in the Chichagof Island district, and Nelson & Tift, operating in the Ketchikan district.

*Yukon River Basin region.*—The Yukon River Basin—comprising the Bonnifield, Chandalar, Chisana, Circle, Eagle, Fairbanks, Fort Gibbon, Fortymile, Hot Springs, Iditarod, Innoko, Kantishna, Koyukuk, Marshall, Rampart, Richardson, Ruby, and Tolovana districts—yielded 68 percent of the total gold output from floating connected-bucket dredges in Alaska in 1938; was the largest producer of gold and silver from other types of placer operations; and was third in total output of gold from lode mines.

The bulk of the gold produced in this region in 1938 came from the operation of 19 floating connected-bucket dredges, which washed approximately 12,750,000 cubic yards of gold-bearing gravels, averaging 52 cents in value of recovered gold to the cubic yard. The open dredging season was 4 to 8 months, although prospecting and preparation of ground for future dredging was continuous throughout the year.

The United States Smelting, Refining & Mining Co., operating six floating connected-bucket dredges—two 10-cubic-foot electrically driven dredges, with 111 and 93 buckets, respectively; three electrically driven dredges, with seventy-eight, seventy-eight, and sixty-eight 6-cubic-foot buckets, respectively; and one shallow-digging electrically powered Yuba dredge, with sixty-eight 3-cubic-foot buckets—was the largest producer of gold in this region in 1938. Dredging operations were started March 10; by March 21, five of the large dredges were in operation, continuing without interruption until early in December. The newly constructed shallow-digging dredge was operated from July to November. The six dredges aggregated 1,453 dredge days compared with 1,261 dredge days in the previous season. The yardage of gravels handled was increased substantially, but the grade was slightly lower than in 1937.

The Alluvial Gold, Inc., second-largest producer of gold in this region in 1938, operated a Diesel-powered dredge (seventy-two 4-cubic-foot buckets) on Coal Creek in the Circle district and washed 430,000 cubic yards of gravel during the period June 10 to November 1.

The North American Dredging Co., operating on Otter Creek in the Iditarod district, started operations June 15, 1938, and closed down for the season November 14. The dredge, equipped with sixty 3½-cubic-foot buckets, handled 295,000 cubic yards of gravel during the active season.

The Riley Investment Co., also operating on Otter Creek in the Iditarod district, used a Diesel-powered dredge (fifty-eight 3½-cubic-foot buckets) and handled 311,180 cubic yards of gravel in 1938. Dredging was started June 7 and continued without interruption until November 21.

Digitized by Google

Other large producers of gold from floating connected-bucket dredges in 1938 were: In the Circle district—Gold Placers, Inc., using a dredge equipped with sixty 4-cubic-foot buckets; C. J. Berry Dredging Co., using a dredge equipped with fifty-eight 3-cubic-foot buckets; and the Deadwood Mining Co., using a dredge equipped with sixty-five 4-cubic-foot buckets; in the Innoko district—the Holky Dredging Co., operating a 4-cubic-foot dredge on Ganes Creek; in the Fortymile district—North American Mines, Inc. (Jack Wade operations), dredging (seventy 4-cubic-foot buckets) on Jack Wade Creek; and in the Hot Springs district—the American Creek Operating Co., using a Yuba Diesel-powered dredge with 2½-cubic-foot buckets on American Creek.

The Yukon River Basin region produced the bulk of the gold output from placer operations in 1938, excluding that from floating connected-bucket dredges. In most of the region the water supply was ample to insure continuous operations; however, in the Fairbanks district there was a shortage of water until the middle of July when rain relieved the condition. The active working season was 110 to 130 days, beginning early in May. In most of the region, particularly the Fairbanks and Tolovana districts, more extensive use of mechanical equipment increased production of placer gold; increased production in other districts was caused by a longer-than-usual working season. The use of dragline excavators, slack-line scrapers, and caterpillar bulldozers, with auxiliary portable washing plants, was the chief method of mining employed by the large operators.

The recovered tenor of gravel handled by the larger placer operators in 1938 ranged from approximately 46 cents to approximately $1 to the cubic yard throughout the region. In the Bonnifield district two operators hydraulicked 30,000 cubic yards of gravel with an average recovered gold content of 56 cents per cubic yard washed. In the Circle district three operators, using dragline equipment, dragline scrapers, and bulldozers with elevated sluice plants, handled 310,000 cubic yards of gravel with an average recovered gold content of 59 cents. In the Fairbanks district three operators, using draglines and bulldozers with elevated washing plants, and in the Fort Gibbon district one operator, using a dragline with elevated sluices, washed an aggregate of 472,000 cubic yards of gravel with an average recovered gold content of 46 cents. In the Fortymile district the Central Development Syndicate, lessee of the Jack Wade Mining Co., hydraulicked, with the aid of two Diesel caterpillar bulldozers, 90,000 cubic yards of muck and 40,000 cubic yards of gold-bearing gravel; the average recovered gold content was 99 cents. In the Iditarod district three operators, using bulldozers, hydraulic giants, elevated washing plants, and specially constructed sluices, handled 440,000 cubic yards of gold-bearing gravel averaging 46 cents recovered per cubic yard. In the Innoko district two operators, employing dragline equipment supplemented by bulldozers and washing plants, handled 391,000 cubic yards of gravel averaging 49 cents recovered per cubic yard.

A typical operation using mechanical equipment in recovery of placer gold, of which there are many examples in the Yukon River Basin region, is that of the Cripple Creek Mining Co., operating on Cripple Creek in the Innoko district. During the open season 260,000 cubic yards of gravel were handled, with an average recovery in value

Digitized by Google

of gold of 55 cents to the cubic yard. Five hydraulic giants were used in stripping the overburden from the paystreak below. A steam-driven dragline exavator was used to bring the pay gravel into the elevated sluice or washing plant. Two pumps were used to furnish adequate water for washing the gravel and to furnish water elsewhere when needed. The company used two caterpillar tractors equipped with bulldozers for general utility work, such as clearing, hauling, etc. The operation began June 20, 1938, and closed down for the season October 20.

Other operators making a notable showing in 1938 and using for the most part dragline excavators and hydraulic equipment as a prime mover of gold-bearing gravel were: The Gold King Mining Co., operating in the Bonnifield district; the Mastadon Mining Co., in the Circle district; Adolph Bock, in the Hot Springs district; the Wolf Creek Mining Co., in the Fairbanks district; and Olson & Co., Vance Hitt, and Peter Miscovich, in the Ruby district. There were more placer operations employing five men or less in the Yukon River Basin region than in any other region in Alaska.

The Yukon River Basin region was the third most productive lode mining region in Alaska during 1938. Most of the lode mines were in the Fairbanks district. The bulk of the gold and silver produced was in the form of bullion sent to local banks and buyers or to the Seattle Assay Office. Some dry gold concentrates were shipped to the Tacoma plant of the American Smelting & Refining Co. Among the larger producers of lode gold were: The Cleary Hill Mines Co., operating the Cleary Hill mine; C. M. Hawkins, operating the Sue and Spaulding mines; and the Hi Yu Mining Co., operating the Hi Yu mine, all in the Fairbanks district.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN ARIZONA

(MINE REPORT)

By T. H. MILLER AND PAUL LUFF

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 199 | Mining industry | 205 |
| Calculation of value of metal production | 199 | Ore classification | 206 |
| Mine production by counties | 203 | Metallurgic industry | 206 |
| | | Review by counties and districts | 212 |

Copper is by far the most important mineral product of Arizona, and the rate of mining operations in the State varies directly with the average sales price of that metal. In 1937 it sold (annual average) for 12.1 cents a pound, and Arizona mines operated at the highest rate since the period 1928–30. The total value of the output of gold, silver, copper, lead, and zinc in 1937 was $90,855,462, the highest recorded since 1929. The sale price of copper started declining in the fall of 1937, and by the end of the year curtailment was in effect in nearly all the large copper-producing districts; it continued throughout 1938, and the total value of the output of the five metals dropped to $58,358,401, or 36 percent compared with 1937, owing to decreased output of copper ore combined with a lower average sales price (9.8 cents a pound) for copper.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

[1] Includes placer sands treated by dry concentration plants.
[2] Dragline and power-shovel excavators with sluices or special amalgamators.
[3] Figures for sluicing include those for drift mining.

*Gold.*—The output of recoverable gold in Arizona decreased from 332,694 fine ounces in 1937 to 305,043 ounces in 1938, or 8 percent. Gold from siliceous ores (chiefly dry and siliceous gold ore) increased 18,444 ounces in 1938 owing to marked increases in gold ore treated by cyanidation in Mohave, Pinal, and Yavapai Counties, but gold from copper ore decreased 43,509 ounces owing to general curtailment in output of copper ore in all the principal copper-producing districts of the State; the output of gold from zinc-lead ore decreased also. Gold from placers increased slightly; as usual, nearly half of it came from a dragline and floating washing plant in Yavapai County. The Copper Queen (Bisbee) branch of the Phelps Dodge Corporation was the leading gold producer in Arizona in both 1937 and 1938, and the United Verde (Jerome) and New Cornelia (Ajo) branches of the company ranked second and fourth, respectively; there were marked decreases in gold output at each of these three properties, but their

Digitized by Google

total represented 39 percent of the State total. Other large gold producers in 1938 included the Goldroad property of the United States Smelting, Refining & Mining Co. in Mohave County, the Mammoth-St. Anthony Limited property in Pinal County, and the Octave unit of the American Smelting & Refining Co. in Yavapai County. Copper

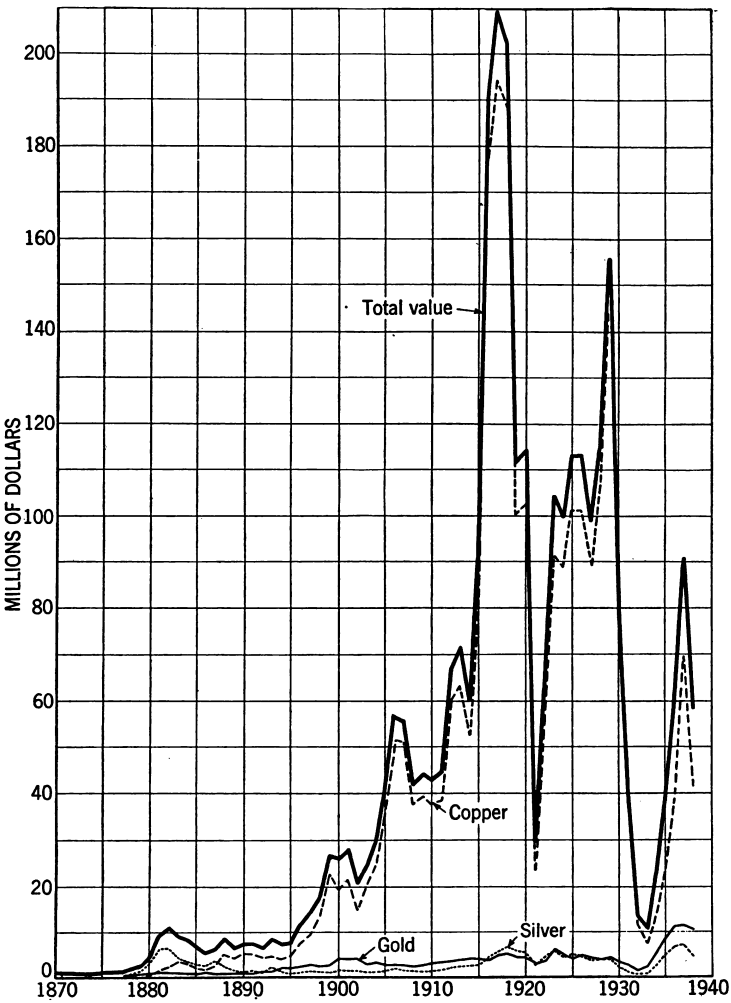

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1938. The value of lead and zinc has been less than $2,000,000 annually except in a few years.

ore yielded 44 percent of the total gold in 1938 compared with 53 percent in 1937, and siliceous ore yielded 49 and 40 percent, respectively.

*Silver.*—The output of recoverable silver in Arizona decreased 21 percent from 1937 to 1938; nearly all the decrease was in silver from

Digitized by Google

copper ore, although silver from lead ore and zinc-lead ore decreased also. Copper ore yielded 61 percent of the silver in 1938 and 68 percent in 1937. The Phelps Dodge Corporation was, as usual, the chief silver producer in Arizona, and in 1938 its three properties (Copper Queen, United Verde, and New Cornelia) produced 51 percent of the State total. Other large silver producers in 1938 included the Montana group of the Eagle-Picher Mining & Smelting Co. in Santa Cruz County, the Ash Peak property of Veta Mines, Inc., in Greenlee County, and the Magma Copper Co. at Superior, Pinal County.

*Copper.*—The mining of copper ore is by far the most important mineral industry in Arizona. In 1937, metals recovered from copper materials were valued at $80,735,047 or 89 percent of the total value of the metal output of the State. Owing to general curtailment of output in the chief copper-producing districts, production of copper ore declined from 19,928,824 tons in 1937 to 13,047,356 tons in 1938, and the value of the metals recovered from copper materials dropped to $48,631,096, or 83 percent of the State total. The total output of copper in Arizona declined 27 percent in quantity and 41 percent in value from 1937, but, despite the marked decrease, Arizona was again the largest copper-producing State. Decreases in copper output (1938 compared with 1937) were noted in five of the seven chief copper districts of Arizona, as follows: The Globe-Miami district, 87,962,902 pounds, owing chiefly to curtailment at the Inspiration property; the Verde (Jerome) district, 26,878,875 pounds; the Ajo (New Cornelia) district, 24,390,066 pounds; the Warren (Bisbee) district, 16,946,064 pounds; and the Mineral Creek (Ray) district, 4,556,588 pounds. Copper from the Copper Mountain district increased 8,652,147 pounds owing to increased output of cement copper from underground leaching operations at the Morenci property, and copper from the Pioneer (Superior) district increased slightly (126,667 pounds). These seven districts contributed more than 98 percent of the total copper output of the State in both 1937 and 1938. Copper materials produced in Arizona in 1938 yielded 418,736,954 pounds of copper, distributed as follows: 10,118,757 tons of copper ore treated by concentration yielded 50 percent, 1,548,387 tons of copper ore shipped for smelting 35 percent, and 1,380,212 tons of copper ore leached and 18,427 tons of cement copper (from mine-water precipitates and underground leaching operations) 15 percent. In 1938 the New Cornelia property of the Phelps Dodge Corporation was again the leading copper producer in Arizona and was followed in order by the Copper Queen and United Verde units of the same company, the Miami Copper Co., the Magma Copper Co., the Inspiration Consolidated Copper Co., the Ray property of the Nevada Consolidated Copper Corporation, and the Morenci property of the Phelps Dodge Corporation.

*Lead and zinc.*—The output of recoverable lead in Arizona in 1938 decreased 14 percent in quantity and 33 percent in value compared with 1937. The output of zinc increased 16 percent in quantity, but it decreased 15 percent in value owing to the lower average sales price. Zinc-lead ore treated by concentration decreased from 212,430 tons in 1937 to 187,694 tons in 1938; 56 percent of the total lead and

Digitized by Google

5 percent of the total zinc in 1938 came from zinc-lead ore. Lead nd zinc increased at both the Montana mine at Ruby (Santa Cruz County) and the Tennessee-Schuylkill mine near Chloride (Mohave County), but the output from the "79" mine in the Banner district (Gila County) decreased markedly. Most of the remainder of the ead produced in 1938 came from crude ore shipped for smelting, hiefly from mines in Cochise, Yavapai, and Gila Counties; nearly ll the rest of the zinc came from zinc-copper ore from the Magma ine at Superior treated by flotation in a new section of the copper oncentrator.

## MINE PRODUCTION BY COUNTIES

*Mine production of gold, silver, copper, lead, and zinc in Arizona, 1937–38, by counties, in terms of recovered metals*

## MINING INDUSTRY

There were large increases in output of copper in 1937 from mines in all seven (Ajo, Bisbee, Globe-Miami, Jerome, Morenci, Ray-Hayden, and Superior) of the principal copper-producing districts in Arizona, but curtailment during 1938 brought about large decreases in yield of copper from all of these districts except Morenci and Superior. The Phelps Dodge Corporation reduced its rate of production at Ajo, Bisbee, and Jerome, but the output of copper from underground leaching operations at Morenci increased; development and test work on the new Morenci ore body continued during both years, and plant construction was expected to begin in 1939. The Magma Copper Co. operated the mine, mill, and smelter at Superior at a normal rate during both 1937 and 1938; in 1938, in addition to copper ore, the company started treatment of zinc-copper ore in a new flotation section of the mill. The Ray property of the Nevada Consolidated Copper Corporation was closed during the summer months, and the output of copper declined. Production at both the Miami and Inspiration properties in the Globe-Miami district decreased in 1938; the Miami Copper Co. continued to treat copper ore by combined leaching and flotation throughout both years, but the Inspiration Consolidated Copper Co. discontinued the dual treatment process January 12, 1938, and straight leaching was used on the ore mined during the remainder of the year. Copper smelting plants at Douglas, Hayden, Clarkdale, Miami, Morenci, and Superior were operated continuously during 1938 but at a much lower rate than in 1937.

Digitized by Google

The average sales prices of lead and zinc declined in 1938, and th output of zinc-lead ore decreased; however, the mining of dry an siliceous ores (chiefly gold ore) continued to increase, and 928,707 ton were produced in 1938 compared with 804,949 tons in 1937.

## ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volum on Gold and Silver.

*Ore sold or treated in Arizona, 1937–38, with content in terms of recovered meta*

| Source | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|---|

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 95,561,691 pounds recovered from ore leached and mine-water precipitates.
[3] Includes 61,739,674 pounds recovered from ore leached and mine-water precipitates.

## METALLURGIC INDUSTRY

The output of ore and old tailings of all classes in Arizona decrease from 20,976,359 tons in 1937 to 14,203,164 tons in 1938.

Gold ore treated at amalgamation mills decreased from 46,654 ton in 1937 to 11,177 tons in 1938, but siliceous material treated at cyani dation plants increased markedly—from 385,086 to 605,367 tons There were substantial increases in ore treated by cyanidation i Mohave, Pinal, and Yavapai Counties.

Digitized by Google

Ore and old tailings treated at concentration plants decreased from 8,203,790 tons in 1937 to 10,546,807 tons in 1938; most of the decrease was in copper ore. Ore concentrated in Arizona in 1938 comprised 30,907 tons of gold ore, 110,632 tons of gold-silver ore, 65,435 tons of silver ore, 10,118,757 tons of copper ore (compared with 17,727,331 tons in 1937), 116 tons of lead ore, 132 tons of lead-copper ore, 60 tons of zinc ore, 32,974 tons of zinc-copper ore, and 187,694 tons of zinc-lead ore. Copper ore from the Miami property and a small part of the copper ore from the Inspiration property, both near Miami, were treated by a combination of leaching and flotation, and these data are included with ore treated at straight concentration plants. Most of the ore from the Inspiration mine in 1938 was treated by straight leaching, the dual treatment having been terminated January 12, 1938.

The following tables give details of the treatment of all ores produced in Arizona in 1937 and 1938.

*Mine production of metals in Arizona, 1937–38, by methods of recovery, in terms of recovered metals*

| Method of recovery | Material treated | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|
| 1937 | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |

[1] Pioneer district lies in both Gila and Pinal Counties.
[2] Old Hat district lies in both Pima and Pinal Counties.
[3] Ellsworth district lies in both Maricopa and Yuma Counties.
[4] Includes districts having a production valued at less than $1,000.

Digitized by Google

In the following review by counties and mining districts only the more important operations are mentioned. Many producing mines and several districts whose output was small, included in the foregoing tables, are omitted from this review.

## COCHISE COUNTY

*Dos Cabezas and Tevis district.*—In 1937 the metal output of the Dos Cabezas and Tevis district was chiefly copper ore from the Tout property, gold ore from the Good Luck and Golden Eagle mines, and placer gold from Inspiration Placers; Inspiration Placers, Inc., operated a dragline dredge and treated 3,116 cubic yards of gravel. In 1938 the plant handled 14,775 cubic yards. The increase in district gold production resulted from resumption of operations at the Dives property by Consolidated Gold Mines, Ltd., which installed a new 200-ton rod mill and treated about 1,500 tons of gold ore.

*Swisshelm district (Webb, Elfrida).*—Nearly all the output of the Swisshelm district in both 1937 and 1938 was gold-silver ore from the Alpine property operated by the Alpine Mining Co.

*Tombstone district.*—The value of the metal output of the Tombstone district in 1938 was $79,700 less than in 1937, owing chiefly to decline in output of gold-silver ore from the Tombstone (Bunker Hill) property, chief producer in the district. There was also a decrease in output of lead ore from the Tombstone Extension and Toughnut mines. The United States Smelting, Refining & Mining Co. suspended operations at the Toughnut mine in June 1937.

*Turquoise district (Courtland, Pearce, Gleeson).*—In 1937 the output of the Turquoise district was mostly silver ore from the Commonwealth mine treated by cyanidation, and copper ore from the Black Diamond and Casey mines. In 1938 the output of copper decreased as both mines were closed, but the output of gold, silver, and lead increased, owing to shipments of silver ore from the Mona mine, lead ore and gold-silver ore from the Silver Bill claim, and lead ore from the Dragoon, Elsicore, Garnet, American, and Arizona properties. The Commonwealth mine was virtually idle in 1938.

*Warren district (Bisbee, Lowell, Warren).*—The value of the metal output of the Warren district decreased from $18,804,704 in 1937 to $12,878,356 in 1938, chiefly as a result of curtailment in output of copper ore from the Copper Queen branch of the Phelps Dodge Corporation. There was also a large decrease in output of copper ore from the Denn and Holbrook mines and of gold ore and lead ore from the Shattuck mine. The Phelps Dodge Corporation operated its Copper Queen branch throughout both years, but the output of copper ore was 9 percent less in 1938 than in 1937. The Copper Queen branch was the largest producer of gold and silver in Arizona in both years and ranked second in copper. The Denn mine was operated throughout both years by the Shattuck Denn Mining Corporation. 105,697 tons of copper ore were shipped to a smelter in 1937 and 72,030 tons in 1938. Lessees operated the Shattuck mine in 1937 and shipped 7,423 tons of lead ore, 5,610 tons of gold ore, and 3,388 tons of copper ore; the property was idle in 1938. The output of copper-gold ore from the McKenna Lease at the Holbrook property (Phelps Dodge Corporation) declined from 42,600 to 5,784 tons.

Digitized by Google

### COCONINO COUNTY

The metal output of Coconino County in both 1937 and 1938 was copper ore, chiefly from claims near Jacob Lake owned by the Los Angeles Exploration & Metals Corporation and operated by lessees. Other producers of copper ore in 1938 were the Pack Rat claim near Valle and the Brown Derby and Little Buck mines in the Ryan (Warm Springs) district.

### GILA COUNTY

*Banner district.*—The output of all metals except gold in the Banner district decreased considerably in 1938 from 1937 owing to the closing in March 1938 of the Christmas copper property and to the sharp decline in output of lead ore and zinc-lead ore from the "79" mine. The Christmas mine, idle since May 1932, was reopened early in 1937 by the Christmas Copper Corporation, and 30,170 tons of copper ore were shipped to a smelter; the output dropped to 6,098 tons in 1938. In 1937 the "79" Lead-Copper Co. was a large producer of lead and zinc, in consequence of the construction of a 60-ton flotation plant; the plant was completed in May, and during the remainder of the year 10,483 tons of zinc-lead ore were treated by concentration, and 3,435 tons of first-class lead ore were shipped to a smelter. In January 1938 the mine and mill were closed, owing to the decline in metal prices. The mine was reopened by lessees who shipped 19 cars of first-class lead ore to a smelter. The increase in district gold production in 1938 resulted chiefly from shipments of gold ore from the Gold Queen, Arizona Apex, and Inseparable mines and lead ore containing gold from the Arizona Apex and Oro Verde properties.

*Globe-Miami district.*—The value of the metal output of the Globe-Miami district decreased from $21,671,026 in 1937 to $8,806,915 in 1938 owing to curtailment in output of copper ore from the Inspiration and Miami properties. In 1937 the Inspiration Consolidated Copper Co. treated 5,122,636 tons of copper ore by leaching and concentration, but in 1938 the output dropped to 1,484,614 tons; most of the ore in 1938 was treated by straight leaching. The output of copper ore from the Miami mine, treated by leaching and concentration, declined from 4,602,205 to 3,338,845 tons. According to the company printed annual report for the year ended December 31, 1938, a small amount of molybdenite (valued at $32,000) was recovered (beginning in August) from copper sulfide concentrates. In 1937 most of the gold production of the district came from the Miami, Inspiration, Abbie, Golden Eagle, Old Dominion, and Porphyry Reserve properties; in 1938 most of it came from the Miami property.

*Green Valley district (Payson).*—The increase in production of gold in the Green Valley district in 1938 resulted chiefly from operation of the Gowan (Verde Falls) property; lessees shipped several cars of gold ore to a smelter. Other producers of gold ore in 1938 included the Tornado, Gray Eagle, and Gold Hill claims.

*Pioneer district.*—Nearly all the output of the Pioneer district in 1938 was silver ore from the Pioneer and El Capitan properties and gold-silver ore from the Marland (Stigall) and Little Four mines. The chief production in 1937 was silver ore from the El Capitan and Silver Dime properties.

*Roosevelt district.*—The output of the Roosevelt district in both 1937 and 1938 was rich gold ore from the Christmas Gift & Good Luck property; the output increased considerably in 1938.

Digitized by Google

### GRAHAM COUNTY

Metal production in Graham County was greater in 1938 than in 1937 owing to increased shipments of lead-silver ore from mines near Klondyke in the Aravaipa district. In 1938 nearly all the output of the county was first-class lead-silver ore from the Grand Reef, Dogwater, Alaman, Aravaipa, and Shim Fein properties in the Aravaipa district; in 1937 most of the output came from the Shim Fein claim.

### GREENLEE COUNTY

The Ash Peak (Duncan) and Copper Mountain (Morenci) were the chief producing districts in Greenlee County in both 1937 and 1938. The Ash Peak mine, virtually the only producer in the Ash Peak district, was operated by Veta Mines, Inc. The company became a large producer of silver and gold in 1937, and the output of each metal increased in 1938. About 64,700 tons of silver ore were treated in the company flotation plant in 1938, and 5,560 tons of similar ore were shipped to a smelter. The output of the Copper Mountain district in both years was mostly copper recovered from leaching old caved stopes at the Morenci branch of the Phelps Dodge Corporation; the production of copper was much larger in 1938 than in 1937, and experimental work and development on the new Morenci ore body continued during 1938. The remainder of the county output in 1938 was chiefly gold ore and gold-silver ore from the Keating and Buzzard Shadow properties in the Copper Mountain district and gold ore from the Gray Mare and Polaris mines in the Copper King Mountain district.

### MARICOPA COUNTY

The value of the metal output of Maricopa County was $116,370 less in 1938 than in 1937, owing chiefly to decline in production of gold from the Vulture and Belmont-McNeil tailing dumps and from the Portmanteau mine. In 1937 more than 80 percent of the gold production of the county came from these three properties. In 1938 most of the production came from the Blue Bird, Portmanteau, and Maricopa mines in the Cave Creek district, the Vulture mine and tailings dump in the Vulture district, the Delta mine in the Salt River Mountains district, and the Belmont-McNeil mine and tailings dump in the Osborn district. Nearly all the ore output of the Cave Creek, Salt River Mountains, and Osborn districts was first-class gold ore shipped to smelters; gold ore from the Vulture mine was treated by amalgamation and concentration, and most of the old Vulture tailings were treated by cyanidation.

### MOHAVE COUNTY

*Cedar Valley district.*—The output of ore in the Cedar Valley district was much less in 1938 than in 1937, but production of gold was larger owing to increase in output of gold ore from the San Francisco mine. A new 40-ton flotation plant was constructed at the mine in 1938, and about 2,600 tons of ore were concentrated. Several thousand tons of tungsten ore from the Boriana mine were concentrated in 1937, but no ore was treated in 1938 as the mill was destroyed by fire; however, a new 150-ton concentration plant was built during the year.

Digitized by Google

*Chemehuevis district.*—The chief production in the Chemehuevis district in 1938 was gold ore from the Gold Dome and Dinero mines and placer gold from the Chief claim.

*Gold Basin district.*—The value ($33,989) of the metal output of the Gold Basin district in 1938 was virtually the same as that in 1937. In 1937 nearly all the output was gold ore treated by cyanidation, chiefly from the Cyclopic property. In 1938, production of gold from this property decreased considerably, but the loss was more than offset by increases at the O. K. & Excelsior, Gold Hill, Golden Rule, Narrow Gauge (Fry), and M. O. mines.

*Maynard and McConnico district.*—The Bimetal (McGuire) property at McConnico was the most important producer in the Maynard and McConnico district in both 1937 and 1938; several hundred tons of gold ore were treated each year by cyanidation. The Dean mine 14 miles east of Kingman was a producer of zinc-lead-silver ore in 1937 but was idle in 1938. Gold-silver ore from the Democrat mine and gold ore from the Southern Cross and Fay properties were treated in 1938 in the Vivian custom mill.

*Minnesota district.*—The Pope mine 40 miles north of Chloride became a large producer of gold ore in 1938; the property was operated by the Arizona-California Exploration Co., and 4,073 tons of ore were treated in the custom cyanide mill of Producers Mines, Inc.

*Music Mountain district.*—Nearly all the output of the Music Mountain district in 1938 was gold ore from the Roosevelt, Music Mountain, and Wierth properties, treated by concentration and cyanidation in the Vivian custom mill.

*Owens (McCracken and Potts Mountain) district.*—In 1937 most of the output in the Owens district was silver-lead ore from the Silver Streak and McCracken mines; gold ore from the Yucca, Greenwood, Mahogany, Kimball, and Golden Eagle properties; and gold-copper ore from the New England mine. In 1938 the chief production was gold ore from the Yucca, Gold Leaf, New England, Gold Chief, and Adela properties; silver ore from the Silver Streak mine; and gold ore and copper ore from the New England mine.

*San Francisco (Oatman, Gold Road, Katherine, Vivian) district.*—Production of gold in the San Francisco district in 1938 was 47,432 fine ounces, an increase of 918 ounces over 1937; production of silver also increased, and the value of the total metal output rose from $1,677,855 to $1,710,776. The largest increase was in output of gold ore from the Goldroad mine of the United States Smelting, Refining & Mining Co. In both years the property was the leading gold producer in Mohave County and the largest producer of gold from siliceous ore in Arizona. The company operated its 300-ton cyanide plant throughout 1938 and treated 125,572 tons of gold ore and 15,769 tons of old tailings.

The output of gold ore and old tailings from 32 properties at Oatman and Gold Road was 203,706 tons in 1938, which yielded 42,457 ounces of gold and 32,438 ounces of silver, compared with 179,585 tons in 1937, which yielded 42,196 ounces of gold and 36,940 ounces of silver. The Tom Reed Gold Mines Co. operated its mine and 300-ton cyanide plant at Oatman continuously in 1938, but the output of gold ore dropped to 25,171 tons from 47,364 tons in 1937, resulting in a substantial decline in production of gold; the mill treated both company and custom ore. In 1938 the Big Jim mine of the United Eastern

Digitized by Google

Mines Co. and the Gray Eagle mine of the Tom Reed Gold Mines Co. were operated as a joint lease by Johnston & Witcher Mines, Inc., and the Tom Reed Gold Mines Co.; 13,700 tons of gold ore were treated in the Tom Reed mill. Lessees continued to operate the Pioneer group in 1937 and 1938; 2,622 tons of gold ore were treated in the Tom Reed mill and 6,111 tons in the Vivian mill in 1938. Lessees also continued to operate the United Western mine, and 4,014 tons of gold ore were treated in the Tom Reed mill in 1938; the property was taken over late in the year by the Vivian Mining Co., and 838 additional tons of ore were treated in the Vivian mill. The Vivian Mining Co. constructed a new 100-ton flotation plant in April 1937 and later added cyanide leaching tanks to treat the gold concentrates; 14,941 tons of gold ore from the Vivian-Lelande group were treated during 1937. In February 1938 the company started buying custom ore, and by the end of the year the mill had treated 18,350 tons of ore, including 13,650 tons from custom shippers. Other large producers of gold ore at Oatman were the Gold Dust, Mossback, Telluride, and Oatman Queen.

The output of gold ore and gold-silver ore from 15 properties in the Katherine section of the San Francisco district was 36,715 tons in 1938, which yielded 4,975 ounces of gold and 45,888 ounces of silver, compared with 23,319 tons in 1937, which yielded 4,318 ounces of gold and 27,527 ounces of silver. Three properties—the Katherine, Arabian, and Philadelphia—operated by the Gold Standard Mines Corporation produced 33,930 tons of ore in 1938; the Katherine was by far the largest producer. The Gold Standard Mines Corporation operated its 300-ton cyanide plant continuously in 1937 and 1938 on both company and custom ore. In 1938 the mill treated 23,529 tons of gold ore from the Katherine mine, 7,659 tons of gold-silver ore from the Arabian mine, and 2,742 tons of gold ore from the Philadelphia mine. In 1938 other large producers of gold ore were the Frisco and Tyro mines. In 1937 the chief producers were the Tyro, Arabian, Philadelphia, Katherine, Frisco, and Pyramid properties.

*Wallapai district* (*Cerbat, Chloride, Mineral Park, Stockton Hill*).—The value of the metal output of the Wallapai district in 1938 was $1,262,478, a decrease of $248,585 from 1937. The output of ore and all the metals, except silver, was less than in 1937; the decline in production of lead was most pronounced. The Tennessee mine of the Tennessee-Schuylkill Corporation at Chloride was the most important producer in the district in both years, ranking second in the State as a zinc producer, second in lead, and seventh in gold. About 54,000 tons of zinc-lead ore from the mine were treated in the company flotation plant in 1938, a decrease from 59,990 tons in 1937; the mill also treated custom ore. The Diana property of the Arizona Magma Mining Co. at Chloride was an important producer of gold-silver ore in both 1937 and 1938; the company treated 25,086 tons of ore by flotation concentration in 1938, an increase of 5,219 tons over 1937. Keystone, Inc., was a large producer of silver ore and gold-silver ore in 1937 through operation of several properties at Mineral Park. In April 1938 the company sold its holdings, including a 100-ton flotation plant, to Alpha-Keystone Mines, Inc. The mill was used in 1938 to treat gold-silver ore from company mines and from custom shippers; most (about 17,500 tons) of the ore came from company mines—the Keystone, Summit, Alpha, Jemison, Blue Bell, and Miner's Hope.

Digitized by Google

The Fountain Head mine was a large producer of gold ore of smelting grade in both 1937 and 1938. Other large producers in 1938 of gold ore were the Rainbow, Golden Eagle, Oro Plata, Idaho, and Lillian mines and of gold-silver ore the C. O. D., Minnesota-Connor, Juno, White Eagle, Golconda, and Good Hope properties. Silver ore from the Alpha, Prince George, Midnight, American Nettie, and Oro Plata properties and lead ore from the Golden Eagle, Fountain Head, White Eagle, St. Louis, and Samoa mines were shipped for smelting; zinc ore from the Idaho mine and zinc-lead ore from the Champion, Columbus, Tintic, and Mary Bell properties were concentrated. In 1937 the General Ore Reduction Co. built a 50-ton flotation plant at Chloride to treat custom ore. The company treated several thousand tons of ore from various mine dumps in the district during the last quarter of 1937 and the first quarter of 1938; operations were suspended in April.

*Weaver (Mocking Bird, Pilgrim, Portland) district.*—The value of the metal output of the Weaver district in 1938 was $477,749, a decrease of $36,418 from 1937. The output of both gold and silver was less than in 1937 owing to the large decline in output of gold ore from the Portland mine, the most important producer in the district in both years; 25,419 tons of gold ore were treated in the cyanide mill at Katherine compared with 44,325 tons in 1937. The Pilgrim mine, a large producer of gold ore in 1936, was operated from January 1 to May 31, 1937, by the Pioneer Gold Mining Co.; on June 1 the property and 100-ton flotation mill were purchased by Producers Mines, Inc. The mill operated throughout the year and treated a total of 18,750 tons of gold ore by concentration; nearly all the concentrates were amalgamated. In January 1938 the company completed conversion of the mill into a 300-ton cyanide plant, and it was used during the remainder of the year to treat both company and custom ore; 10,571 tons of gold ore and 20,236 tons of old tailings from the Pilgrim property were treated. Producers Mines, Inc., also purchased the Klondyke and Scout groups in 1937; these properties were large producers of gold ore in both 1937 and 1938. More than 14,000 tons of gold ore from the Klondyke mine and 3,250 tons of similar ore from the Scout property were treated in 1938 by cyanidation. The Mocking Bird mine was also a large producer of gold ore in both years. Other leading producers of gold ore in 1938 were the Dixie Gold and Dixie Queen properties.

### PIMA COUNTY

The output of gold, silver, and copper in Pima County declined markedly from 1937 to 1938, owing to curtailment in production of copper ore at the New Cornelia mine at Ajo, most important producer in the county. The output of copper ore from this mine declined 18 percent, and that of copper more than 24,000,000 pounds; however, the mine maintained its rank as the largest producer of copper in Arizona. About 4,980,000 tons of copper ore were treated in 1938 in the flotation plant. Considerable copper was produced in both 1937 and 1938 from the Old Hat (Santa Catalina Mountains) district as a result of operations by the Catalina Consolidated Copper Co. at the Geesaman & Daily groups. The company, organized early in 1937, built a new 100-ton flotation plant and from August to the end of the year treated 10,300 tons of copper ore; production continued

Digitized by Google

until June 1938, when operations were suspended. The remainder of the county output in 1938 was mostly gold ore from the Allison mine in the Baboquivari district, the Jaeger property in the Cababi district, and various claims in the Arivaca district; and silver ore from the Blue Jay mine in the Helvetia district. The Blue Jay mine produced considerable silver ore in 1937 also. Most of the lead produced in the county in 1937 came from the State of Maine group in the Empire district; the property was idle in 1938.

### PINAL COUNTY

*Bunker Hill district* (*Copper Creek*).—The output of gold, silver, and copper in the Bunker Hill district was greater in 1938 than in 1937. Nearly all the output in both years was copper-molybdenum ore and old tailings from the Childs property, operated by the Arizona Molybdenum Corporation. In 1938 about 44,200 tons of ore and 35,000 tons of old tailings were treated by flotation concentration and 143 tons of high-grade copper ore were shipped for smelting.

*Casa Grande district.*—The value of the metal output of the Casa Grande district in 1938 was more than double that in 1937, owing to increase in shipments of gold ore from the Desert Queen, Turning Point, Greenback, Mammon, and Christmas Gift properties.

*Martinez Canyon district.*—The large output of silver and lead in the Martinez Canyon district in 1937 resulted from operations at the Silver Bell mine by the Sunbeam Gold Mining Co., the only producer. The company built a 50-ton flotation plant and treated about 3,000 tons of lead-silver ore; in addition, it shipped several hundred tons of first-class lead-silver ore and silver ore to a smelter. The property was idle in 1938.

*Mineral Creek district* (*Ray*).—The Nevada Consolidated Copper Corporation resumed operations at the Ray property in January 1937, and during the year treated 1,166,441 tons of copper ore in the 12,000-ton flotation plant; in addition, it shipped 3,678 tons of crude copper ore, 3,690 tons of copper precipitates, and 766 tons of old tailings for smelting. In 1938 the mine and mill were idle from June 16 to August 15, and the output of copper ore declined to 1,097,532 tons. As a result, the output of copper and gold from the Mineral Creek district decreased. There was, however, a large increase in the district output of lead in 1938 owing to shipments of lead ore from the Ray Silver-Lead property.

*Mineral Hill district.*—The chief production in the Mineral Hill district in both 1937 and 1938 was silver ore from the Rainbow Silver mine near Superior. The output of ore from the mine was much less in 1938 than in 1937.

*Old Hat district* (*Oracle, Mammoth*).—The value of the metal (gold, silver, copper, and lead) output of the Old Hat district in Pinal County was $961,097 in 1938, an increase of $422,996 over 1937. This substantial gain resulted from increase in output of ore from the Mammoth-St. Anthony property operated by Mammoth-St. Anthony, Ltd. The company treated 128,876 tons of ore in 1938 by gravity and flotation concentration and cyanide leaching. Lead concentrates (3,257 tons) containing considerable gold were smelted in the company 20-ton lead furnace; lead bullion, gold bullion, molybdenum, and vanadium were shipped to eastern markets. About 36,600 tons of

Digitized by Google

similar ore from the New Year-Mohawk group were treated in the Mammoth-St. Anthony mill during 1938; the property, operated by the Molybdenum Gold Mining Co., was a large producer in 1937 also. The Catalina mine was a fairly large producer of gold ore in 1937 but was idle in 1938. The remainder of the district output in 1938 was mostly gold ore from the Old Gold Camp, Smith, North Star, and Bishop properties.

*Pioneer district* (*Superior*).—The value ($4,369,653) of the metal output of the Pioneer district in 1938 was greater than that of any other district in Pinal County, owing chiefly to the large output of gold, silver, copper, and zinc from the Magma mine, of gold from the Lake Superior & Arizona group, and of silver from the Reymert mine. The mine, mills, and smelter of the Magma Copper Co. were operated nearly all of 1938. The copper mill treated 246,690 tons of copper ore containing 0.027 ounce of gold and 1.18 ounces of silver to the ton and 5.12 percent copper; the new zinc unit treated 32,974 tons of zinc-copper ore containing 0.015 ounce of gold and 2.514 ounces of silver to the ton, 2.08 percent copper, and 8.41 percent zinc; and 54,975 tons of crude copper ore from the mine were smelted. In 1937, the output of the mine was 302,360 tons of copper ore; no zinc-copper ore was treated. The output of gold ore of smelting grade from the Lake Superior & Arizona group was 9,068 tons in 1938, a decrease of 1,645 tons from 1937; the ore contained 3,017 ounces of gold, 7,206 ounces of silver, and 101,229 pounds of copper. The Reymert mine was operated in both years by lessees; about 16,000 tons of silver ore were shipped in 1938 for smelting, an increase of 2,900 tons over 1937. The Belmont mine also was a large producer of silver ore during both years.

*Ripsey district.*—Production of gold, silver, and copper in the Ripsey district was much greater in 1938 than in 1937, owing to increased output of gold-silver ore from the Old Ripsey mine and to shipments of gold-silver ore from the Joe Fishback property. The Old Ripsey mine was the only producer in the district in 1937 and the most important producer in 1938.

*Riverside district.*—Nearly all the output of the Riverside district in 1938 was gold ore from the Arizona Gold and Lucky Strike mines and copper ore from the Peg Leg claim.

### SANTA CRUZ COUNTY

*Harshaw district.*—The value of the metal output of the Harshaw district was $137,903 less in 1938 than in 1937 owing to substantial reduction in output of lead-silver ore from several producers. The largest decrease (4,765 tons) was reported from the Trench mine. In 1937 the property was operated by the Gold Canyon Mining Co. and was the largest producer of silver and lead in the district. The American Smelting & Refining Co. purchased the mine in December 1937 and operated it throughout 1938, but the output of ore was small and came entirely from development, as no stoping was done. The Hardshell, World's Fair, Flux, Humboldt, and Salvador mines also were fairly large producers of lead and silver during both years.

*Oro Blanco district* (*Ruby*).—The Oro Blanco district is the chief producing area in Santa Cruz County, as the Montana mine of the Eagle-Picher Mining & Smelting Co. is in the district; this mine is

Digitized by Google

the outstanding producer of lead and zinc in the State, ranks third in output of silver, and also produces much gold and copper. The output of zinc-lead ore from the mine and the yield of gold, silver, and copper were less in 1938 than in 1937, but production of lead and zinc was much greater; 132,450 dry tons of ore were treated in 1938 in the company 300-ton flotation plant. The remainder of the district output was mostly gold ore from the Old Glory & Sargent, Margarita, and Azteca properties and gold-silver ore from the Old Soldier claim.

*Palmetto district.*—Several cars of copper ore from the Three R property were shipped to a smelter in 1937, but the property was idle in 1938.

*Patagonia (Washington, Duquesne) district.*—In 1937 the output of the Patagonia district was mostly lead-silver ore from the Mowry, Pocahontas, and Empire properties and copper ore from the Paymaster claim. In 1938 the chief production was gold ore from the Guajolote mine and lead ore from the Duquesne property.

### YAVAPAI COUNTY

*Agua Fria district.*—The chief output in the Agua Fria district in both 1937 and 1938 was copper ore from the Burzog (Minor) property.

*Big Bug district.*—The value of the metal output of the Big Bug district decreased from $444,397 in 1937 to $405,917 in 1938 owing to the closing in October 1937 of the Gladstone-McCabe property, which made a large output of gold ore from 1934 to 1937, inclusive. The Iron King mine was the most important producer in the district in both 1937 and 1938. The property was operated by Burnham & Fields from January 1 to May 10, 1937, when it was purchased by the Iron King Mining Co.; a total of 22,602 tons of first-class gold ore was shipped for smelting in 1937. The company built a 200-ton flotation plant in 1938, which was placed in operation in September; 13,477 tons of gold ore were milled, and 17,078 tons of crude ore were shipped for smelting. The Belcher mine was a large producer of gold ore in 1937, and the old Blue Bell and Hackberry properties yielded a fairly large output of copper ore; the Belcher and Blue Bell properties were both idle in 1938, and the Hackberry mine was closed in February 1938. The output of placer gold in the district increased to 1,047 ounces in 1938 owing to operation of a dragline dredge at the Lawson group by the Hassayampa River Mining Co. and to operation of a washing plant, equipped with four Ainlay bowls, at Hill Placers.

*Black Canyon district.*—The value of the metal output of the Black Canyon district was $173,225 in 1938 compared with $192,988 in 1937; the output of gold and copper declined, but that of silver and lead increased. Two fairly important producers of gold in 1937—the Golden Belt and French Lily mines—were idle in 1938. The Golden Turkey Mining Co. was the chief producer in the district in both years. The company operated its mine and 50-ton flotation plant continuously, and the output of ore (25,765 tons) and production of gold (2,550 ounces) in 1938 were virtually the same as in 1937, but production of silver and lead was greater. The remainder of the district output in 1938 was chiefly rich silver ore from the Silver Cord and Thunderbolt mines.

Digitized by Google

*Black Rock district.*—In 1937 the output of the Black Rock district was mostly copper ore from the Amazon and Paydirt properties. In 1938 the chief production was rich gold ore from the Gold Bar mine.

*Castle Creek district.*—Most of the lode output of the Castle Creek district in both 1937 and 1938 was silver ore from the Little Joker claim and gold ore from the Golden Aster mine. Placer gold was recovered largely from the Buckhorn property in 1937.

*Cherry Creek district.*—Metal production in the Cherry Creek district in 1938 was virtually the same as in 1937; nearly all the output in both years was gold ore of smelting grade. The chief producers in 1938 were the Logan, Sunnybrook, Cross Cut, Gold Bullion, Gold Eagle, D. D., Gold Ring, Fox No. 1, Red Pig, and Volcano properties.

*Copper Basin district.*—There was a substantial increase in the metal output of the Copper Basin district in 1937 over 1936 owing to operation of the U. S. group, idle for many years. This property was taken over early in 1937 by U. S. Mines, Inc.; about 1,600 tons of zinc-lead ore were hauled to the Yarnell flotation plant, and 244 tons of first-class lead ore were shipped to a smelter. However, the property was closed late in 1937 and was idle in 1938. Most of the remainder of the district lode output in 1937 was copper-gold ore from the Plymouth mine and zinc ore from the Boston-Arizona property. The chief production in 1938 was gold ore of smelting grade from the Gold Star and McNary properties and placer gold from the Smith & Roby claim.

*Eureka district.*—The value of the metal output of the Eureka district was $563,552 in 1938, a decrease of $108,320 from 1937. Production of gold, silver, lead, and zinc from the Hillside mine, most important producer in the district, was greater than in 1937, but there was a substantial decrease in output of copper ore from the Bagdad property as it was closed in April 1938. The Hillside mine and 200-ton flotation plant were operated continuously in 1938 by Hillside Mines, Inc., and 38,850 tons of gold-silver ore containing copper, lead, and zinc were concentrated; the property was a large producer of gold, silver, and lead. About 75,500 tons of copper ore from the Bagdad mine were treated by concentration in 1937, but the output dropped to 29,200 tons in 1938. Most of the remainder of the district output in 1937 was gold ore from the Oro Bueno, Turnbeaugh, and Belle-Mammoth properties. Comstock-Dexter Mines, Inc., built a 100-ton flotation plant at its property in 1938 and treated 4,220 tons of gold ore. The Santa Maria Mining Corporation was organized early in 1938 to operate several mines near Hillside, including the Turnbeaugh, Pocahontas, and Anarchist groups. The company purchased the 25-ton cyanide plant of the Oro Bueno Mining Co. and moved it to the Turnbeaugh property; during 1938 about 1,500 tons of gold ore were treated in the plant, and 340 tons were shipped for smelting. Other producers of gold ore in 1938 included the Mammoth-Belle, Mystery, Southern Cross, and Juan Olea properties.

*Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) district.*—The output of gold in the Hassayampa district increased from 760 fine ounces in 1937 to 1,319 ounces in 1938; however, the value of the metal output of the district has decreased considerably since the closing in September 1936 of properties operated by Bradshaw Mines, Inc. In 1937 the chief output was gold ore from the Climax,

Digitized by Google

Alma, Great Divide, Pine Grove, Sacramento, and Storm Cloud properties and silver ore from the Cornucopia mine. In 1938 most of the production was gold ore from the Gold Basis, Great Divide, Sterling, Pine Grove, Climax, Sacramento, Ten Spot, Forest & Forlorn Hope, Alma, The Mary, and Hot Roll properties. Small-scale operations at various prospects in the district in both 1937 and 1938 resulted in shipments of small lots of rich gold ore.

*Humbug district.*—Rich gold ore from the Little Joseph, Humbug Gold Mines, and Acquisition properties was shipped in 1938 for smelting; the Little Joseph and Acquisition mines were producers in 1937 also. The placer output of the district in both years was recovered by various operators working on Cow, French, and Humbug Creeks.

*Lynx Creek district.*—Production in the Lynx Creek district in both 1937 and 1938 was placer gold and silver; it was recovered chiefly from property operated by the Lynx Creek Placer Mine Co. The company continued to be the largest producer of placer gold in the State, although its output was 18 percent less in 1938 than in 1937. The large floating washing plant and two draglines were operated continuously from January 1 to October 30, 1938, and treated 556,115 cubic yards of gravel.

*Martinez (Congress) district.*—The value of the metal output of the Martinez district increased from $22,781 in 1937 to $135,966 in 1938 owing to treatment of old Congress tailings and to shipments of low-grade gold ore from Congress waste dumps. The Congress Mining Corporation rebuilt the 300-ton cyanide plant at the Congress mine and from May to the end of 1938 treated 51,625 tons of old tailings; in addition, lessees shipped 5,536 tons of low-grade ore from the waste dumps for smelting. The rest of the district output in 1938 was mostly gold ore of smelting grade from the Coronado (Golden Wave), Blue Bird, and Key properties. Nearly all the output in 1937 was first-class gold ore from the Blue Bird and Coronado mines.

*Mineral Point district.*—In 1938 the output of the Mineral Point district was chiefly gold ore of smelting grade from the Buster and Lucky Joe claims. In 1937 the chief producers were the Emmett & Golden Eagle, Gold Dyke, and Gringo claims.

*Peck district.*—The Swastika mine near Cleator was the most important producer in the Peck district in both 1937 and 1938; several cars of rich silver ore were shipped each year for smelting.

*Pine Grove district.*—The value ($83,050) of the metal output of the Pine Grove district in 1938 was virtually the same as in 1937. The Gladiator-War Eagle property became a large producer of first-class gold ore of smelting grade in 1937, and shipments continued throughout 1938. Other producers of gold ore in 1938 were the Harrington, Oro Belle, and Del Pasco properties.

*Silver Mountain district (Wagoner).*—Gold ore from the Silver Dollar mine was the chief output of the Silver Mountain district in both 1937 and 1938. The property was operated by Colossal Mines, Inc., until May 5, 1938, when operations ceased.

*Tip Top district.*—Nearly all the output of the Tip Top district in both 1937 and 1938 was silver ore from the "76" mine; several hundred tons of ore were concentrated, and exceptionally rich silver ore was shipped to a smelter. The property was operated both years by the La Bajada Exploration, Engineering & Equipment Corporation.

Digitized by Google

*Verde district* (*Jerome*).—The value of the metal output of the Verde district was $8,004,559 in 1938 compared with $13,873,393 in 1937. The loss resulted from curtailment in output of copper ore from the United Verde mine. The property (both the open-pit and underground sections of the mine) was operated continuously in 1938 by the Phelps Dodge Corporation; 557,762 tons of ore were smelted and 230,187 tons of ore were concentrated, but the output of copper ore declined 39 percent from 1937. The property ranked second in the State in production of gold and silver and third in copper. The 1,600-ton flotation plant and the 5,000-ton copper smelter owned by the company were operated throughout the year. However, the company dismantled one reverberatory furnace at the smelter and four Great Falls type converter stands and installed two new Pierce-Smith type converters. The United Verde Extension Mining Co. worked its mine until April 30, 1938, when operations were closed permanently and the company was dissolved. During the first 4 months of the year 7,762 tons of copper ore were shipped to the Phelps Dodge smelter at Clarkdale. The remainder of the district output in 1938 was gold-silver ore (3,853 tons) shipped from the Iron King-Equator group by A. B. Peach.

*Walker district.*—In 1937 most of the output of the Walker district was gold ore from the Golden Fleece, Farnum, and Cherry Grove claims. In 1938 the chief production was gold ore and gold-silver ore from the Sheldon mine.

*Walnut Grove district.*—Production of gold from both lode and placer mines in the Walnut Grove district in 1938 increased over 1937. The increase from lode properties resulted from operations at the Gold Bug-Gold Spring group by the Gallup Gold Mining Co. The company constructed a 100-ton cyanide plant in 1938, and 1,500 tons of gold ore were treated during the year. In 1937 Gold King Mines, Inc., operated the property and treated gold ore in a concentration mill. Various placer operators working on Placeritas Gulch and French Creek recovered more gold than in 1937.

*Weaver district* (*Octave*).—Production of gold in the Weaver district increased from 10,047 fine ounces in 1937 to 14,478 ounces in 1938, owing chiefly to the large output of gold ore from the Alvarado mine. However, the Octave mine remained the most important producer in the district, and its output of gold in 1938 was greater than in 1937. The mine and the flotation and cyanidation plant were operated continuously by the American Smelting & Refining Co.; 27,480 tons of gold ore were treated in 1938. Liberty Hill Gold Mines, Ltd., completed construction of a 75-ton cyanide plant at the Alvarado mine in June 1938, and during the last 6 months of the year the plant treated 14,808 tons of gold ore. The Johnson mine, a large producer of gold ore in 1937, was closed April 5, 1938, after treating 960 tons of gold ore by amalgamation and concentration. The Yarnell property also was a large producer of gold ore in 1937, but the mine and 50-ton flotation mill were idle most of 1938; about 1,300 tons of gold ore were concentrated during the last quarter of 1938. Other producers of gold ore in 1938 included the Dora, York, Cuba, and Rincon properties. The output of placer gold in the district increased from 201 fine ounces in 1937 to 363 ounces in 1938; the chief producer in 1938 was the Universal Placer Mining Corporation operating a 1¼-yard power shovel and a dry concentration plant at the Thunder Bird property.

Digitized by Google

*White Picacho district.*—In 1937 nearly all the output of the White Picacho district was gold ore of smelting grade from the Young property 12 miles northeast of Morristown; in 1938 this mine was also the most important producer in the district. The Independence mine produced 65 tons of lead-silver ore in 1938.

### YUMA COUNTY

The value of the metal output of Yuma County was $78,907 in 1938, or $108,284 less than in 1937. This sharp decline resulted from the closing in September 1937 of the Swansea copper mine in the Santa Maria (Planet) district. The mine and 250-ton flotation mill were operated 8 months in 1937 by the American Smelting & Refining Co., 19,111 tons of copper ore were concentrated, and the property was by far the most important producer in the county; the mine was idle in 1938. More than a third of the gold produced in the county in both 1937 and 1938 was recovered by various placer operators, chiefly in the Plomosa, La Paz, Dome, and Laguna districts. The output of gold from lode mines in the county increased considerably in 1938, owing to increased shipments of rich gold ore (containing appreciable silver) from the Big Eye mine in the Castle Dome district. Most of the output in the Ellsworth district in 1938 was gold ore of smelting grade from the Golden Star, Desert, Gold Leaf, Blue Eagle, and Centroid properties and copper-gold ore from the Critic mine. Exceptionally rich gold ore was produced in 1938 from the Ah-Ve-Aha claim in the La Paz district. The chief output of the Plomosa district was gold ore from the Julius and Yum Yum properties and silver ore from the R. & A. mine.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN CALIFORNIA

**(MINE REPORT)**

By CHARLES WHITE MERRILL AND H. M. GAYLORD [1]

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 231 | Metallurgic industry | 240 |
| Calculation of value of metal production | 232 | Review by counties and districts | 245 |
| Mine production by counties | 236 | | |
| Mining industry | 239 | | |
| Ore classification | 239 | | |

The total value of the gold, silver, copper, and lead recovered from ores, old tailings, and gravels in California in 1938—$47,767,894—was greater than that of the metal output in any year since 1856. The continued rise in total value in 1938 was due entirely to the expanding output of gold, as the values of silver, copper, and lead were all less than in 1937 and no zinc was produced in 1938.

Gold increased 12 percent in both quantity and value compared with 1937, whereas silver declined 10 percent in quantity and 25 percent in value; copper, 85 percent in quantity and 88 percent in value; and lead, 58 percent in quantity and 67 percent in value. No zinc output in 1938 was reported, but a small production was made in 1937. The total value of the five metals was 7 percent higher than in 1937; of the total, gold represented 96 percent, silver 3.5 percent, and copper and lead together less than 0.5 percent.

Nevada County continued in 1938 to be the largest contributor to the nonferrous metal wealth of California; it produced 24 percent of the State total value of the four metals, 25 percent of the total lode and placer gold, and 41 percent of the lode gold. Sacramento County (largely from gold dredging) contributed 10 percent of the total value of the four metals; Kern County (largely from gold and gold-silver ores), 8 percent; Amador County (two-thirds from gold ore and one-third from placer gravels), 8 percent; Calaveras County (three-fifths from gold ore and two-fifths from placer gravels), 6 percent; Yuba County (largely from gold dredging), 5 percent; and Merced County (largely from gold dredging), 4 percent. Thus, 7 of the 43 counties producing the metals in California in 1938 supplied two-thirds of the State total.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

[1] The assistance of O. Y. Sharman is acknowledged.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935-38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935-37: Yearly average weighted Treasury buying price for newly mined silver.
[3] Yearly average weighted price of all grades of primary metal sold by producers.
[4] $0.64646464.

*Mine production of gold, silver, copper, lead, and zinc in California, 1934–38, and total, 1848–1938, in terms of recovered metals*

| Year | Mines producing | | Ore, old tailings, etc. (short tons) | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|---|
| | Lode | Placer | | Fine ounces | Value | Fine ounces | Value |
| 1934 | 867 | 1,784 | 2,356,091 | 719,063.92 | $25,131,284 | 844,413 | $545,883 |
| 1935 | 1,112 | 1,487 | 3,337,773 | 890,430.00 | 31,165,050 | 1,191,112 | 856,112 |
| 1936 | 903 | 639 | 4,635,691 | 1,077,442.00 | 37,710,470 | 2,103,799 | 1,629,392 |
| 1937 | 913 | 838 | 4,925,014 | 1,174,578.00 | 41,110,230 | 2,888,265 | 2,234,073 |

[1] Figures not available.
[2] Short tons.

*Gold.*—During the 10-year period ended with 1938 the value of the gold output of California increased 438 percent—from $8,526,703 in 1929 to $45,889,515 in 1938; the gain in 1938 over 1937 alone was equivalent to more than half the total value of the output in 1929. In quantity the 1938 gold output was greater than in any year since 1862, and in value it was greater than in any year since 1856. Gold production in 1938 exceeded that in 1937 by 12 percent,, whereas

Digitized by Google

production in 1937 exceeded that in 1936 by only 9 percent; this accelerating rate of increase is noteworthy in view of the upward trend that already has continued for 10 years.

Although the data for gold production in California before 1901 do not segregate placer and lode gold it appears certain that the output of lode gold was larger in 1938 in both quantity and value than in any year in the history of the State. The quantity and value of placer gold produced are known to be higher in 1938 than in any year since 1900. Moreover, it is probable that the placer miners have not enjoyed so productive a year since unrestricted hydraulic mining flourished, over 50 years ago. Even better days for placer mining were anticipated when construction of large débris dams on rivers in the Sierra Nevada Mountains was begun under supervision of the California Débris Commission with River and Harbor Work funds. Early in 1939 the first débris dam, that on the North Fork of American River near Auburn, was completed, making practicable the reopening

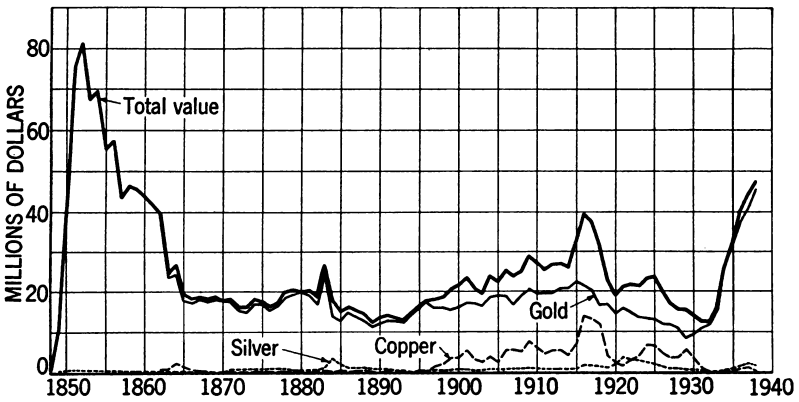

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in California, 1848–1938. The value of lead and zinc has exceeded $1,000,000 in only a few years.

of a number of hydraulic mines in the large drainage basin above the dam. Another, the Upper Narrows Dam on Yuba River near Smartville, was projected for construction during 1939.

The 25 leading gold properties, listed in the following table, produced 56 percent of the total gold output of the State in 1938. Newcomers to the list in 1938 were 3 lode mines—the Cactus Queen, the Iron Mountain (which came just short of making the list in 1937), and the Sheepranch—and 4 connected-bucket dredging properties—the Merced dredge No. 1 of the Merced Dredging Co., the Butte Unit of Yuba Consolidated Gold Fields, the San Joaquin dredge No. 1 of the San Joaquin Mining Co., and the Yreka dredge of the Yreka Gold Dredging Co. These operations replaced on the list 4 lode mines and 3 connected-bucket dredging properties that failed to maintain their rank among the leading 25 gold producers in 1938. It will be noted that 12 of the 25 leading in 1938 derived their gold from gold ores, 11 from gravels worked by connected-bucket dredges, and the remaining 2 from gold-silver ores; the producers ranking first, second, and sixth are in the Grass Valley-Nevada City district.

| Cosumnes dredge | Cosumnes River | Sacramento | Cosumnes Gold Dredging Co. | Do. |
| Yreka dredge | Greenhorn | Siskiyou | Yreka Gold Dredging Co | Do. |

*Silver.*—The bulk of the silver output of California in 1938 was more localized than that of the gold; the 10 leading properties, listed in the following table, produced 82 percent of the total silver. Newcomers to the list in 1938 were the Standard mine at Bodie (Mono County) and the Idaho Maryland mine at Grass Valley (Nevada County), which displaced on the list the Walker mine (Plumas County) and the Spanish mine (Nevada County). Of the 10 leaders, 5 produced gold-silver ores, 4 gold ores, and only 1 straight silver ore. In addition to the yield by the companies listed, some output of silver was reported from almost every lode and placer mine producing in the State in 1938.

*Ten leading silver producers in California in 1938, in approximate order of output*

| Mine | District | County | Operator | Source of silver |
|---|---|---|---|---|
| Cactus Queen | Mojave | Kern | Cactus Mines Co | Gold-silver ore. |
| Lava Cap | Grass Valley-Nevada City. | Nevada | Lava Cap Gold Mining Corporation. | Gold ore. |
| Starlight | Mojave | Kern | Lodestar Mining Co | Gold-silver ore. |
| Kelly | Randsburg | San Bernardino. | Frank Royer | Do. |
| Golden Queen | Mojave | Kern | Golden Queen Mining Co. | Gold ore. |
| Grigsby (Palisade) | Calistoga | Napa | Graham Loftus Oil Corporation. | Gold-silver ore. |
| Silverado-Kentuck | Mount Patterson | Mono | Sierra Consolidated Mines, Inc. | Silver ore. |
| Empire Star | Grass Valley-Nevada City. | Nevada | Empire Star Mines Co., Ltd. | Gold ore. |
| Standard | Bodie | Mono | Roseklip Mines Co | Gold-silver ore. |
| Idaho Maryland | Grass Valley-Nevada City. | Nevada | Idaho Maryland Mines Corporation. | Gold ore. |

Digitized by Google

*Copper.*—The production of recoverable copper in California was much smaller in 1938 than in 1937, largely as a result of part-time operation at the Walker mine in the Genesee district of Plumas County. Despite curtailed operations, the Walker mine yielded three-fourths of the copper output of the State during 1938.

*Lead.*—The small output of recoverable lead in California in 1938 was mined principally in Inyo, Nevada, and Riverside Counties.

*Zinc.*—No zinc output in California in 1938 was reported.

*Gold produced at placer mines in California, 1934–38, by classes of mines and by methods of recovery*

| Class and method | Mines producing [1] | Material treated (cubic yards) | Gold recovered | | |
|---|---|---|---|---|---|
| | | | Fine ounces | Value | Average per cubic yard |
| Surface placers: | | | | | |
| Gravel mechanically handled: | | | | | |
| Connected-bucket dredges: [2] | | | | | |
| 1934 | 17 | 59,210,208 | 193,773.38 | $6,772,380 | $0.114 |
| 1935 | 20 | 75,014,000 | 236,403.70 | 8,274,130 | .110 |

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[2] In 1934 there were 28 connected-bucket dredges in operation; in 1935, 36; in 1936, 40; in 1937, 46; and in 1938, 48.

[3] Includes all placer operations using dragline-type power shovel for excavating and delivering gravel to floating washing plant. Prior to 1936 no dragline operation had more than one dredge, but in 1936 there were 31 dragline dredges; in 1937, 55; and in 1938, 80.

[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry-washers, etc.

## MINING INDUSTRY

The decrease in combined value of the output of copper, lead, and zinc more than offset the net increase in combined value of the output of lode gold and silver in California in 1938; the total value of the output of the five metals from lode mines was equivalent to 98 percent of that in 1937. It was the placer-mining section of the industry that was responsible for the rising total value of the output of the five metals in 1938; the value of placer production increased 21 percent compared with 1937. In 1938, 44 percent of the State gold output was recovered at placer mines compared with 40 percent in the preceding year.

Dredges of the connected-bucket type handled 78 percent of the gravel mined and recovered 66 percent of the placer gold in 1938—a very small decline from the proportion of the total gravel handled and the total gold recovered by this method in 1937.

The second most important method—dragline dredging [2]—continued its spectacular rise as a means of recovering placer gold. The first dragline dredge production in the United States was reported in California in 1933, when two outfits, starting work late in the year, recovered less than 100 ounces of gold. In 1938, 77 operations were working 80 outfits; they treated 16 percent of the yardage and recovered 21 percent of the gold produced at placer mines. A small but progressive decline in the average value of gold recovered per cubic yard by dragline dredges has been noted since 1934, whereas the average recovered by connected-bucket dredges has varied little; in 1938 the average recovery per yard by dragline was $0.056 higher than the average ($0.112) by connected-bucket dredges.

Nonfloating washing plants to which gravel was delivered by mechanical means showed a large increase in yardage handled in 1938 over 1937, but the average gold recovered from the material treated continued to decline from the average in 1935 to 1937. Some of these nonfloating washing plants were stationary; others were built to move on skids, wheels, tracks, or by other means. Dragline excavators, power shovels, slack-line excavators, trucks, and other machines were used in delivering the gravel to these washing plants.

Small-scale hand methods, described in a recent report,[3] showed a substantial increase in 1938 over 1937, due perhaps to continuance of industrial unemployment.

Increases in yardage treated and gold recovered in 1938 at hydraulic mines but small decreases at drift mines were reported.

### ORE CLASSIFICATION

Of the 4,648,249 tons of ore (including 988,330 tons of old tailings) sold or treated in 1938, 94 percent was dry and siliceous gold ore, 4 percent dry and siliceous gold-silver ore, and most of the remainder copper ore. In 1937 there was a much larger proportion of copper ore and more silver ore and a smaller proportion of gold ore and gold-silver ore.

## METALLURGIC INDUSTRY

During 1938, as in former years, the bulk of the ore and virtually all the old tailings were treated at amalgamation and cyanidation mills (with or without concentration equipment); 70 percent of the total ore and 91 percent of the combined ore and old tailings were treated at such mills in 1938. Almost all the remaining ore and all the rest of the old tailings were treated at concentrating mills. A total of 12,750 tons of ore was shipped for direct smelting. Comparing 1938 with 1937 there was an increase of 11 percent in ore and a decrease of 23 percent in old tailings treated at gold and silver mills; the total ore and old tailings so treated in the 2 years varied less than 1 percent. The quantity of material treated in 1938 at concentrating mills decreased 43 percent and the quantity of crude ore smelted 46 percent. The decrease in quantity of concentrates shipped in 1938 for smelting was due in part to limited operations at the Walker mine in Plumas County, which made very large shipments of copper concentrates in 1937. The dry gold concentrates shipped in 1938 were of higher grade than those shipped in 1937.

Most companies mining in California in 1938 owned and operated their own metallurgical plants, but a number of custom mills also were operated in the State. The leading operators of metallurgical plants receiving custom material were the Idaho Maryland Mines Corporation, Grass Valley, Nevada County (cyanidation of ore and concentrates); Amador Metals Reduction Co., Jackson, Amador County (cyanidation of concentrates); Burton Bros., Inc., Rosamond, Kern County (cyanidation of ores); Western Graphite Co., Lake Hughes, Los Angeles County (flotation of ore); Golden Queen Mining Co., Mojave, Kern County (cyanidation of ore); and Keeler Gold Mines, Inc., Keeler, Inyo County (cyanidation of ore). During 1938 the Amador Metals Reduction Co. and Western Graphite Co. ceased operations, and by the end of the year their plants had been dismantled. It is interesting to note that these two plants were the only

Digitized by Google

ones in the group that did not derive part of the material treated from mines managed by their operators. The largest metallurgical custom plant in California continued to be the State's only smelter—the Selby lead plant of the American Smelting & Refining Co., Selby, Contra Costa County.

*Mine production of metals in California in 1938, by methods of recovery, in terms of recovered metals*

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures.
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 2,541,016 fine ounces from lode mines and 49,788 fine ounces from placers.
[4] East Belt district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.
[5] Mother Lode district lies in Amador, Calaveras, Eldorado, Mariposa, and Tuolumne Counties.
[6] Included under "Combined districts."
[7] Not reported.
[8] Exclusive of lode output, which is included under "Combined districts."
[9] Exclusive of placer output, which is included under "Combined districts."
[10] Camanche district lies in Amador, Calaveras, and San Joaquin Counties.
[11] Chidago district lies in Inyo and Mono Counties.
[12] Randsburg district lies in Kern and San Bernardino Counties.
[13] Dale district lies in Riverside and San Bernardino Counties.
[14] Morongo district lies in Riverside and San Bernardino Counties.
[15] Includes following districts: Camanche in Amador County; Butte Creek (lode), Centerville, Forbestown (lode), and Stirling City (placer) in Butte County; Sherman and Slate Range in Inyo County; Kaiser Creek in Madera County; Hunter Valley (placer) in Mariposa County; Dog Creek and May Lundy in Mono County; Butcher Ranch (lode), Canada Hill, and Dutch Flat (lode) in Placer County; Genesee, Rich Bar (lode), and Wolf Creek (placer) in Plumas County; Dale (placer) in Riverside County; Monumental in San Bernardino County; Pine Valley in San Diego County; Centerville (lode), Iron Mountain, North Cow Creek, and Old Diggings, in Shasta County; Depot Hill, in Sierra County; Greenhorn (lode) in Siskiyou County; La Grange in Stanislaus County; and Browns Valley, Challenge (placer), and Yuba River in Yuba County.

## AMADOR COUNTY

*East Belt district.*—The Wiljobar Corporation worked the Defender mine in the East Belt district during 1938. The Fort Ann mine was one of the larger producers of gold ore in the district. The A. E. Kent Dredging Co. operated a dragline dredge on South Sutter Creek near Volcano.

*Ione district.*—The Arroyo Seco Gold Dredging Co. dredged 2,212,565 cubic yards of gravel on Dry Creek 3 miles west of Ione and recovered 12,091 ounces of gold; the company operated one dredge equipped with eighty-six 6-cubic foot buckets throughout 1938 and another dredge with sixty-five 2½-cubic foot buckets during January and February. E. L. Lilly started operations with a dragline dredge October 7. The Humphreys Gold Corporation began operations with a dragline dredge January 28 and continued throughout the rest of the year; the company used three electrically powered dragline excavators and an electrically powered floating washer. The Rim Cam Gold Dredging Co. operated a dragline dredge on Dry Creek 6 miles north of Ione. The Horton mine near Buena Vista treated 30,000 cubic yards of gravel by hydraulicking and recovered 548 ounces of gold.

*Mother Lode district.*—The Argonaut Mining Co., Ltd., in the Mother Lode district near Jackson was on a production status in 1938 from January 1 to February 15 and from July 16 to the end of the year; an underground fire caused the suspension of output. Gold ore was treated by amalgamation in the company 300-ton ball mill and flotation plant, and the concentrates were shipped for smelting. The Central Eureka Mining Co. worked the Central Eureka and Old Eureka mines throughout 1938. According to the company printed annual report for the year ended December 31, 1938, 49,253 tons of gold ore, largely from the Old Eureka, were milled. During the early months of the year the company shipped its concentrates for cyanide treatment elsewhere, but after additions to its metallurgical plant the company treated its concentrates and current tailings by cyanidation and flotation. The Central Tailings Co., which had worked in part on the current tailings from the Central Eureka mine, went out of business. Gold production at the Fremont Gover depended largely on mine dumps during the early months of the year, but after July the ore treated came entirely from underground mining. The Kennedy Mining & Milling Co. operated its mill on ore during the early months of 1938; production from treatment of the company's old tailings in its 1,000-ton cyanide plant was continuous. The Keystone Mine Syndicate treated 11,944 tons of ore from its property 3 miles north of Martell; the ore yielded 1,178 ounces of gold by amalgamation and smelting of flotation concentrates. The Delta Tailings Co. continued to cyanide, in its 600-ton plant, material derived from a deposit of old tailings collected as a delta on one of the streams draining the Mother Lode district. The R. & M. Mining Co. handled approximately 124,000 cubic yards of gravel and recovered 699 ounces of gold by dragline dredging on Indian Creek. The Lincoln Gold Dredging Co., River Pine Mining Co., and Wolin-Hall & Wackman operated dragline dredges in the district.

## BUTTE COUNTY

*Butte Creek district.*—The Humphreys Gold Corporation began operations on the Fitts property with a dry-land dredge November 6, 1938, and continued work until the end of the year. The McLain drift mine was operated throughout 1938.

*Centerville district.*—A stationary washing plant, to which gravel was delivered by power shovels and trucks, was used in 1938 to treat gravel from the Hintz mine; operations were carried on from August 23 to December 16.

*Forbestown district.*—The Idaho Maryland Mines Corporation suspended work at the Forbestown group of properties November 30, 1938, after several years of production and an intensive exploration campaign. During the year 5,157 feet of development headings were driven and 1,612 feet of diamond drilling done. Ore from the mine was treated in a 300-ton amalgamation and flotation plant; the concentrates were shipped to the company cyanide plant at Grass Valley.

*Golden Summit district.*—The Table Mountain Dredging Co. began operations on Thompson's Flat with a dragline dredge April 22, 1938.

*Magalia district.*—A nonfloating washing plant on the Coleman property, to which gravel was delivered by mechanical excavation, was the most productive operation in the Magalia district in 1938.

*Oroville district.*—The Oroville district continued in 1938 to be one of the leading sources of placer gold in California; dredges of both the connected-bucket and dragline types were large producers. The Butte Gold Dredging Co. sold its dragline dredge (1½-cubic-yard dragline excavator) in April to Lord & Bishop, who continued the operation throughout the rest of the year. Consuelo Mines terminated production by its two dragline dredges early in the year. The Gold Hill Dredging Co. launched an electrically powered connected-bucket dredge, equipped with seventy-four 9-cubic-foot buckets, on the Kister Ranch early in 1938 and produced steadily until the end of the year. The Penn Dredging Co. moved its dragline dredge from Honcut Creek in Butte County to Nevada County after producing during the first 3 months of 1938. The connected-bucket dredge of the Oroville Gold Dredging Co. was damaged severely by floods in Feather River but resumed production before the end of 1938. William Richter operated a large dragline dredge throughout the year on land adjoining Feather River. Cinco Mineros Co. operated a 1½-cubic-yard dragline excavator and floating washing plant in the district.

*Yankee Hill district.*—The Surcease mine treated 23,987 tons of gold ore by cyanidation and flotation in 1938 and recovered 4,911 ounces of gold and 8,982 ounces of silver; the concentrates were shipped for smelting.

## CALAVERAS COUNTY[4]

*Camanche district.*—The Comanche Gold Dredging Co. operated its connected-bucket dredge during 1938 along Mokelumne River and dredged gravel in Amador, Calaveras, and San Joaquin Counties. Camanche Placers, Ltd., operated a dredge equipped with sixty-one 2½-cubic foot buckets at Camanche until May 23, when the work was suspended permanently. The Pacific Placers Engineering Co. oper-

[4] See also Julihn, C. E., and Horton, F. W., Mineral Industries Survey of the United States; California—Calaveras County, Mother Lode District (South): Bureau of Mines Bull. 413, 1938, 140 pp.

Digitized by Google

ated a dry-bank washing plant on the Cook property west of Valley Springs from February until the end of the year. Lessees operated a dragline dredge on the K. D. Winship Estate property in the Camanche district until June 8. The Lancha Plana Gold Dredging Co. operated its dredge with eighty-four 6-cubic foot buckets throughout 1938 on its properties along Mokelumne River. E. L. Lilly discontinued dragline dredging between Camanche and Wallace August 9, after working from the first of the year. The Wallace Dredging Co. operated an electrically powered connected-bucket dredge with sixty 3-cubic foot buckets in Calaveras and San Joaquin Counties along Bear Creek near Wallace.

*Campo Seco district.*—The Pacific Placers Engineering Co. operated a dry-bank washing plant on the Robbins claims from June to the end of 1938.

*Copperopolis district.*—The Jumbo Consolidated Mining Co. treated a substantial tonnage of gold ore from the Mt. King mine in the Madam Felix section of the Copperopolis district during 1938; the company increased the daily capacity of its flotation mill to 195 tons. The Western Empire Mines Co., Ltd., worked the Royal mine in the same section of the Copperopolis district; the ore was treated by amalgamation and flotation, and the resulting concentrates were shipped to a smelter.

*East Belt district.*—The St. Joseph Lead Co. worked its Sheepranch mine from January 5 until the end of 1938, and the mine was by far the largest producer in the East Belt district. The S. O. S. Mining Co. closed the S. O. S. drift placer mine in October after recovering 58 ounces of gold from 2,200 cubic yards of gravel, mined by hoist and bucket.

*Jenny Lind district.*—The Milton Gold Dredging Enterprise operated its electrically powered dragline dredge on South Gulch near Milton throughout 1938. C. J. Thompson operated a small connected-bucket dredge with twenty-seven 1⅛-cubic foot buckets during the year; the gravel was cemented so tightly that a dragline excavator was used to work ahead of the dredge to loosen the gravel so that the bucket line could dig it.

*Mother Lode district.*—A development campaign with some production was carried on throughout 1938 at the Big Springs mine in the Mother Lode district. The Carson Hill Gold Mining Corporation treated 379,618 tons of ore at its Carson Hill mill at Melones in 1938—the largest tonnage of ore treated at any single mill in California. Only one company tonnage in the State exceeded it—that of the Empire Star Mines Co., Ltd., in the Grass Valley-Nevada City district of Nevada County. The Carson Hill 1,100-ton mill treated the ore by amalgamation and concentration, followed by regrinding of the concentrates and their return to the pulp circuit for cyanidation, and recovered 24,650 ounces of gold and 6,653 ounces of silver. The Le Roi Mines, Inc., operated the Easy (Easyz) Bird mine in the Mokelumne Hill section of the Mother Lode throughout 1938; in addition to production of a substantial tonnage of ore, 1,500 feet of development drifts were driven as part of the company development campaign. The Mother Lode Central Mines, Inc., closed down its Marble Springs and Bullion Quartz claims April 16, after operating from the first of the year. The dragline dredging operation of the Triangle

Digitized by Google

Mining Co. southeast of San Andreas was taken over by the General Dredging Corporation November 8 and continued until the end of the year; equipment consisted of a floating washing plant and a dragline excavator with a 1¼-cubic yard bucket. A dragline dredge was operated from September 15 until the end of 1938 on Domingo Creek 3 miles north of Angels Camp. Another dragline dredge was operated from July 1 until September 10 on Chili Gulch. The San Andreas Dredging Co. worked a Diesel-powered dragline dredge in the San Andreas section of the Lode from August 20 until the end of 1938. The Universal Dredging Corporation operated a dragline excavator and a floating washer on Calaveras River from October 1 until the end of the year. The Vallecito Mining Co., Inc., operated the Vallecito Western drift mine on Six Mile Creek throughout 1938, mined 917 tons of gravel underground, and treated 27,223 cubic yards of old tailings.

### ELDORADO COUNTY

*East Belt district.*—The Middle End mine in the East Belt district of Eldorado County was operated in 1938 by Cosumnes Mines, Inc.; 950 tons of gold ore yielded 124 ounces of gold by amalgamation and 430 ounces of gold from the smelting of flotation concentrates.

*Mother Lode district.*—The Beebe Gold Mining Co. continued its operation of the Beebe mine in the Georgetown section of the Mother Lode throughout 1938 but suspended work at the Alpine mine before the end of the year; the ore was treated by flotation, and the concentrates were cyanided. Ore from the Black Oak mine, operated by R. J. Wilson throughout 1938, was treated by amalgamation and flotation, and the resulting concentrates were shipped to a smelter. The Kelsey Mining Co., Inc., conducted an exploration program at the Kelsey mine until July 1, when the Kelsey Mining Corporation took over the property; gold ore was produced throughout the year. The Lode Development Co. worked the Rozecrans mine in the Garden Valley section of the Lode throughout 1938 and recovered a substantial output of gold from the treatment of gold ore by amalgamation, flotation, and smelting of concentrates. The Middle Fork Gold Mining Co. worked the Sliger mine intermittently. The Horse Shoe Dredging Co. operated a dragline dredge on Buck's Bar on the North Fork of Cosumnes River from October 15 until the end of 1938.

*West Belt district.*—The Big Canyon mine in the Shingle Springs area of the West Belt district—the largest mining operation in Eldorado County—was worked by The Mountain Copper Co., Ltd., throughout 1938; the ore was treated by flotation, and the resulting concentrates were shipped to a smelter. Big Canyon Dredge (a dragline outfit) treated 760,000 cubic yards of gravel in Big Canyon Creek and recovered 3,476 ounces of gold. The Crystal mine 3 miles south of Shingle Springs was taken over by a new management in February 1938, and on October 5 the operating company was incorporated as the El Dorado Crystal Mine. During the early months of the year, a 100- to 125-ton all-slime, countercurrent decantation cyanide mill was built; milling of dump ore was begun July 12, but from September on the mill feed was entirely newly mined ore. Offices, a change house, an assay plant, and other structures were erected at the property, in addition to the mill.

Digitized by Google

### FRESNO COUNTY

*Friant district.*—There were a number of small lode and placer operations in the Friant district in 1938. The largest production was made by the Grant Service Rock Co., Cons., which produced gold as a byproduct of its sand and gravel business.

### HUMBOLDT COUNTY

*Orleans district.*—Hydraulicking at the Pearch mine made it the largest gold producer in Humboldt County in 1938.

### IMPERIAL COUNTY

*Cargo Muchacho district.*—O'Brien Mines, Inc., which succeeded Socorro Mines, Inc., April 1, 1938, as operator of the American Girl mine, produced 54,155 tons of gold ore. The ore was treated in the company 160-ton flotation mill, and the resulting 1,192 tons of copper concentrate shipped for smelting contained 7,773 ounces of gold, 3,054 ounces of silver, and 73,588 pounds of copper. In addition to operating a custom cyanide mill near Andrade in 1938 Holmes & Nicholson Mining & Milling Co. operated the Cargo Muchacho group of claims in the nearby Cargo Muchacho district. The Sovereign Development Co. conducted a development campaign at the Sovereign mine throughout 1938 and produced some ore, which was treated by cyanidation. Small quantities of gold and silver were recovered from the cyanide leaching of the Tumco old tailings.

### INYO COUNTY

*Cerro Gordo district.*—The Morning Star Keeler Lease treated 2,500 tons of ore and 800 tons of old tailings from the Morning Star mine between April 5 and October 15, 1938, recovering 595 ounces of gold and 6,357 ounces of silver by cyanidation. The Santa Rosa mine shipped a small quantity of lead ore rich in silver. Keeler Gold Mines, Inc., treated a small tonnage of old tailings from the Trovine mine.

*Chidago district.*—The Cardinal Gold Mining Co., one of the ten leading lode gold producers in California during 1937, ceased operations August 29, 1938, owing to exhaustion of known ore bodies. In 1938, until that date, 36,468 tons of ore were treated by flotation and 1,397 tons of concentrates shipped to a smelter; the concentrates contained 8,580 ounces of gold, 2,485 ounces of silver, and 70,323 pounds of copper.

*Coso district.*—A number of small operators were reported working ore and old tailings in the Coso district during 1938.

*Darwin district.*—The Darwin Lead Co. shipped a small quantity of argentiferous lead ore from the Defiance mine in 1938.

*Echo Canyon district.*—The Inyo Consolidated Mines, Inc., which operated the Inyo mine during 1938, treated 1,500 tons of ore by amalgamation and recovered 309 ounces of gold.

*Mt. Argus district.*—Ore mined at the Oneida property in 1938 was treated by cyanidation after being crushed to ¼-inch mesh; 432 ounces of gold were recovered from 2,453 tons of ore.

*Sherman district.*—The Argus Mining Co., organized in February 1938, operated the Arondo mines under a lease and purchase agreement.

Digitized by Google

*Slate Range district.*—The Gold Bottom Mines, Inc., worked the Copper Queen group of claims throughout 1938; the ore mined was treated in the company 25-ton flotation mill, and the resulting concentrate was shipped for smelting.

*South Park district.*—Burton Bros., Inc., worked the Ruth mine throughout 1938.

*Union district.*—A substantial tonnage of gold ore from the Reward mine, also known as the Brown Monster, was shipped during 1938.

*Wild Rose district.*—The Silver Ball and Skidoo mines were the leading producers in the Wild Rose district in 1938.

### KERN COUNTY

*Cove district.*—The Kern Mines, Inc., treated 36,410 tons of ore from the Big Blue mine by flotation during 1938 and shipped the concentrates—containing 4,934 ounces of gold and 4,901 ounces of silver—to a smelter. During the year 1,198 feet of development headings were driven.

*Green Mountain district.*—The Piute Mining Co. operated the Skyline mine in 1938.

*Mojave district.*—The Cactus Mines Co., which operated the Cactus Queen mine in the Middle Butte section of the Mojave district, was the leading silver producer in California during 1938 and one of the larger gold producers as well, despite the fact that this mine was only a prospect 2 or 3 years ago. The first dividend—$184,000—was paid during 1938. The gold-silver ore produced was treated by cyanidation and flotation, and the resulting concentrates were shipped for smelting. The Eureka Lease reported the production of 6,375 tons of gold ore in 1938 and its shipment to a custom cyanide plant for the recovery of 2,293 ounces of gold and 5,151 ounces of silver. The Fairview mine in the Rosamond section of the Mojave district was operated throughout 1938. The Golden Queen Mining Co., the largest producer in the Mojave district in 1938, operated on gold ore throughout the year. In addition to the company output of ore, an almost equal quantity of custom ore was treated at its 450-ton cyanide plant. During 1938, 13,003 feet of development headings were driven at the property. The Karma mine, one of the old properties of the district, yielded a small quantity of gold-silver ore. A substantial tonnage of ore was shipped from the Middle Butte property. The Lodestar Mining Co., one of the leading producers in the district, shipped gold-silver ore for treatment at the Golden Queen custom mill. Burton Bros., Inc., worked the Tropico mine throughout 1938 and in addition to treating ore from its own property conducted a large custom mill business; the company policy of accepting very small shipments of custom ore has been a major factor in the development of the Mojave and nearby mining districts. Development work by Whitmore Mines, Inc., and by lessees on the Whitmore property resulted in the production of a small quantity of ore. Lessees worked the Yellow Dog mine.

*Randsburg district.*—In 1938 the Butte Lode Mining Co. treated 2,846 tons of ore and recovered 830 ounces of gold and 239 ounces of silver by amalgamation. Small tonnages of ore and old tailings were treated at the King Solomon property. A considerable tonnage of low-grade ore from the Operator mine was handled by the Operator

Digitized by Google

Consolidated Mines Co. The Anglo American Mining Corporation, Ltd., which operated the Yellow Aster mine, was the leading producer in the Randsburg district. Material produced from the company open pit was treated by stage crushing and screening to eliminate the larger part of the bulk as waste; the undersize was ground and amalgamated, and the tailings were sent to the company cyanide plant where they were treated along with large quantities of old tailings. In all, 189,979 tons of ore and 374,694 tons of old tailings were handled to recover 14,012 ounces of gold and 4,062 ounces of silver.

### LOS ANGELES COUNTY

The Western Graphite Co. flotation mill at Lake Hughes, which had treated custom ore for several years, suspended operation during 1938; the mill was dismantled.

*Cedar district.*—The Governor Mine Co., the largest mine in the Cedar district in 1938, treated a substantial tonnage of ore and old tailings from the Governor mine by amalgamation.

*Neenach district.*—A small quantity of ore was shipped during 1938 from the Valvue mine for treatment at custom flotation and cyanide mills.

### MADERA COUNTY

A number of small lode and placer mines were active in the Hildreth and Potter Ridge districts during 1938.

### MARIPOSA COUNTY

*Colorado district.*—Lessees operated the Schroeder group from February 16 until the end of 1938 and produced 329 tons of ore, from which 469 ounces of gold and 61 ounces of silver were recovered by amalgamation.

*Hunter Valley district.*—The Cotton Creek Mining Co. treated 2,037 tons of gold ore between May 1 and the end of 1938 and recovered 459 ounces of gold and 219 ounces of silver; the company built a 35-ton amalgamation and flotation mill during the year. The Mt. Gaines Mining Co. produced a substantial tonnage of gold ore. Cyanidation of 3,015 tons of old tailings at the Ruth Pierce mine yielded 153 ounces of gold and 126 ounces of silver; a 72-hour leaching period was used at the 15-ton cyanide leaching plant.

*Mother Lode district.*—The Bandarita Mining Co. treated 3,251 tons of ore from its property in the Mother Lode district by amalgamation and flotation during 1938 and recovered 401 ounces of gold and 322 ounces of silver. The Bondurant Mining & Milling Co. and the Carda Mining Co. (Champion mine) were active. The Boston California Mining Co. installed a 100-ton flotation mill at the Malvina mine and treated a substantial quantity of ore before the end of 1938. Operation of the Miocene No. 2 and Goldbug claims in the Coulterville section of the Lode yielded 145 tons of ore, from which 559 ounces of gold and 120 ounces of silver were extracted by amalgamation. The Pacific Mining Co., which operated the Pine Tree and Josephine mines, continued to be the leading producer of gold in Mariposa County; the company operated its 150-ton flotation mill throughout the year. The Trebor Corporation began operations with a floating washing plant fed by a 1¾-cubic-yard dragline excavator on Mariposa Creek

Digitized by Google

September 8. The Nutting Dredging Co. also operated a dragline dredge in the district. The Placer Properties Co., Inc., operate a dragline dredge using a dragline excavator on Mariposa Creek throughout 1938.

*Whitlock district.*—The Diltz mine was the leading producer in the Whitlock district during 1938. M. T. Tresidder, a lessee on the Miner's Hope mine, treated 1,327 tons of ore and recovered 269 ounces of gold and 79 ounces of silver before his lease terminated September 22. The Our Chance Mining Co. transferred the Our Chance mine to A. E. Clark January 1; 271 tons of ore produced at the property during 1938 yielded 182 ounces of gold and 28 ounces of silver.

### MERCED COUNTY

*Snelling district.*—The connected-bucket dredges in the Snelling district produced virtually all the gold output of Merced County in 1938. The Merced Dredging Co. operated one electrically powered dredge with sixty 9½-cubic-foot buckets throughout the year. The San Joaquin Mining Co. dredged gravel 1½ miles west of Snelling; its boat was equipped with sixty-four 9½-cubic-foot buckets. The Snelling Gold Dredging Co. had two electrically powered connected-bucket dredges in operation throughout 1938; one had sixty-six 7-cubic-foot buckets and the other seventy-two 7-cubic-foot buckets. Yuba Consolidated Gold Fields, the largest producer in the district, worked two dredges of the connected-bucket type, one equipped with seventy-two 9-cubic-foot buckets and the other with seventy-one 5¾-cubic-foot buckets.

### MODOC COUNTY

*High Grade district.*—Modrell Bros. prospected the Trinity and Trinity Extension properties and produced a small quantity of gold as a result of test runs during 1938.

### MONO COUNTY

*Bodie district.*—The Roseklip Mines Co., which worked old dumps on the group of claims formerly operated by the Standard Consolidated Mining Corporation, was the largest producer of gold in Mono County in 1938; the ore was treated in a 300-ton cyanide plant. No underground development work was done on the property.

*Masonic district.*—A small quantity of gold ore was treated at the Chemung mine in 1938.

*May Lundy district.*—The Log Cabin mine was worked in 1938 by the Mutual Gold Corporation from the first of the year until April 20.

*Mount Patterson district.*—Sierra Consolidated Mines, Inc., suspended operations at the Silverado-Kentuck mines during 1938, owing to exhaustion of ore; a large quantity of silver ore was mined and treated by flotation in 1938 before the property was closed down. In 1937 this property was the leading silver producer in California.

### NAPA COUNTY

*Calistoga district.*—The Graham Loftus Oil Corporation took over the Grigsby (Palisade) mine from the Coast Range Mining Corporation during 1938. Production of gold-silver ore and its treatment by flotation were continued; concentrates were shipped for smelting.

Digitized by Google

## NEVADA COUNTY

*Grass Valley-Nevada City district.*—Gold production from the lode mines of the Grass Valley-Nevada City district in 1938 made it again the leading metal-producing district in California and among the largest in value of metal production in the United States. Operation of the Grass Valley Bullion Mines, Inc., property continued under the company working agreement with the Idaho Maryland Mines Corporation; all the ore produced was treated at the Idaho Maryland plant. During the year a reversal of the court decision with respect to extralateral rights was a severe blow to the latter company, but early in 1939 negotiations were reported under way to settle the dispute without further litigation. The Daisy Blue Mine, Inc., worked its property from September 14 to December 3. The Empire Star Mines Co., Ltd., continued operations at its mines in Nevada and Yuba Counties. In the Grass Valley section of the Grass Valley-Nevada City district, the Empire, North Star, and Pennsylvania mines formed one of the most productive operating units in the State; in the Nevada City section of the district, the company worked the Murchie mine. In addition, the company operated the Zeibright property on Bear River near Emigrant Gap and the Pennsylvania mine at Browns Valley in Yuba County. The Newmont Mining Corporation was a very large holder of stock in these enterprises. The Golden Center mine was operated throughout the year by Cooley Butler. The Great Northern Gold Mines, Inc., worked its property 3½ miles northeast of Nevada City throughout 1938 and treated 3,000 tons of ore in its flotation mill to recover 60 tons of concentrates containing 820 ounces of gold; the company did 500 feet of development work. In 1938 the Idaho Maryland mine, operated by the Idaho Maryland Mines Corporation, attained the distinction of being the most productive single mining operation in California. According to the company annual report for the year ended December 31, 1938, 331,406 tons of ore were stoped and more than 400,000 tons of ore developed; the company paid $1,063,406.30 in dividends during 1938, bringing its total dividends to date to $3,584,429. A decision for the company in the United States Circuit Court of Appeals for the Ninth District, which held that the company was not engaged in interstate commerce and hence did not operate under the provisions of the Wagner Act, was of great importance in clarifying labor relations at gold mines in California. The Lava Cap Gold Mining Corporation operated throughout 1938 and treated 108,720 tons of ore by amalgamation and flotation to recover 30,321 ounces of gold and 301,008 ounces of silver. Not only was this company one of the leading gold producers of the State, but its silver production was one of the largest in California; 16,700 feet of development work were done during the year. The Campbell Grass Valley Mining Co. mined 5,444 tons of gold ore at the Norambagua mine 5 miles south of Grass Valley; 2,183 ounces of gold and 454 ounces of silver were produced. Late in 1938 the mill was shut down, and underground work was diverted to exploration and development. The Atlas Gold Dredging Corporation operated a washing plant and a dragline excavator with two 2½-cubic-yard buckets on Deer Creek. The Gold Star Dredging Co. began dragline dredge operations on the Douglas property on Deer Creek 2 miles west of Rough and Ready September 28; the equipment consisted of a

Digitized by Google

1-cubic-yard all-steel washing plant and a dragline excavator with a 1-cubic-yard bucket. The Dakins Co. began dragline dredging on the Gilham and Yue claims on Wolf Creek in October and continued until the end of 1938. On May 16 the dragline dredge equipped with a 3-cubic-yard dragline excavator, moved by the Innis Dredging Co. from the Oroville district in Butte County, began operations on Deer Creek that were continued until the end of 1938. This company took over management of the Deer Creek Placer Mining Co., which had operated its dragline dredge on the property during the early months of the year.

*Washington district.*—The Bradley Mining Co., largest producer in the Washington district in 1938, operated the Spanish mine throughout the year; 22,990 tons of ore were treated by cyanidation and flotation to yield bullion, containing 976 ounces of gold and 6,477 ounces of silver, and concentrates, containing 3,566 ounces of gold, 38,687 ounces of silver, 234,440 pounds of lead, and 114,963 pounds of copper. The Shovel Placer Mining Co. treated a large quantity of gravel at a stationary washing plant to which the gravel was delivered by the use of power shovels and trucks. Omega Mine, Inc., lessees from the South Yuba Mining & Development Co., operated the Omega mine by hydraulicking.

*You Bet district.*—A dry-land dredge using a ⅞-cubic-yard dragline excavator worked the Shorty Jefferies claim during 1938, handled 5,000 cubic yards of gravel, and produced 144 ounces of gold.

### PLACER COUNTY

*Auburn district.*—Operation of the Gaylord drift mine in 1938 yielded 344 ounces of gold. In addition, numerous lode and placer mines were operated in the Auburn district.

*Butcher Ranch district.*—The Monarch Mining Co. worked the Monarch mine from January 15 to June 2, 1938; a 100-ton countercurrent decantation cyanide plant was used.

*Dutch Flat district.*—The Canyon Mines Corporation operated the Rawhide group 5 miles east of Towle throughout 1938.

*Iowa Hill district.*—The Campbell Gold Mines, Ltd., mined 1,057 cubic yards of gravel from the Campbell drift mine during 1938 and shipped 160 ounces of gold. The McGeachin Mining Co. and lessees on the Jupiter, Big Dipper, Hazelrath, Weber, Schwab, and Winchester claims in Shirttail Canyon produced 164 ounces of gold by drift mining.

*Lincoln district.*—Pantle Bros. operated a portable washing plant, to which gravel was delivered by a dragline excavator with a 1-cubic-yard bucket, at Auburn Ravine placers during 1938; 500,000 cubic yards of gravel were treated and 1,808 ounces of gold recovered. F. O. Bohnett also operated a nonfloating outfit. The Fay Placer mine 2 miles east of Lincoln was worked by a dragline dredge using a dragline excavator from March 9 until the end of the year; in addition to the gold produced, the gravels yielded a considerable quantity of zircon sand. The Lincoln Gold Dredging Co. worked its dragline dredge near Lincoln. Jasper-Stacey Co. worked its property 4 miles east of Lincoln throughout 1938 by dragline dredging, using a 2-cubic-yard electrically powered dragline excavator.

Digitized by Google

*Ophir district.*—The Alabama California Gold Mines Co. worked the Alabama mine throughout 1938. The Auburn-Chicago Mining Co., which had operated the Chicago, Elizabeth, and Mary Len claims for several years, discontinued operations November 25. The Oro Fino Consolidated Mines worked the Oro Fino mine; the company ore was treated in a 300-ton amalgamation and flotation plant erected during the year, and the concentrates were shipped to the Idaho Maryland custom cyanide plant. The Burm-Ball Mining Co. operated the Sisley mine throughout 1938. The Three Star Mining Co. unwatered the Three Star mine in 1938 and produced a small quantity of gold ore before the end of the year. The Gold Hill Dredging Co. operated a dredge of the connected-bucket type, equipped with eighty-seven 8½-cubic-foot buckets, on the Barton Ranch and Chabot property throughout the year. The General Utility Corporation operated a dragline dredge with a 1¼-cubic yard excavator from the first of the year until March 3, on a property 3 miles southeast of Roseville. The Panob Gold Dredging Co. operated a nonfloating washing plant to which gravel was delivered by a dragline excavator with a 1¼-cubic-yard bucket from August 5 until December 22. The Antelope Gold Dredging Co. operated a dredge of the connected-bucket type, with thirty-eight 3-cubic-foot buckets, on Antelope Creek from the first of the year until November 25. The Oro Bell Dredging Co. handled 239,700 cubic yards of gravel in its connected-bucket dredge, equipped with seventy-two 4½-cubic-foot buckets, in 1938; 1,360 ounces of gold were recovered.

### PLUMAS COUNTY

*Crescent Mills district.*—The North Canyon Mines, Inc., produced 20,020 tons of gold ore in 1938 from the Droege and New York mines, which yielded 3,251 ounces of gold; the ore was treated in the company 70-ton amalgamation and flotation mill. The Indian Valley Mining Co., Inc., worked the Standart mine throughout the year and built a 125-ton amalgamation-flotation mill to replace the 10-stamp mill formerly used at the property. The Glacier drift mine yielded 365 ounces of gold from 2,881 tons of gravel as a result of intermittent operations during 1938.

*Genesee district.*—The Walker mine (operated by the Walker Mining Co., an affiliate of the Anaconda Copper Mining Co.), the outstanding mine in Plumas County for many years, dropped to second place in value of production during 1938 owing to decreased output. The property was on a curtailed basis from January 1 to May 31, on a shut-down basis from June 1 to October 31, and on an operating basis from November 1 to December 31. According to the company printed annual report for the year ended December 31, 1938:

> 75,160 wet tons of ore were broken, 66,822 dry tons of ore were milled, and 2,516 dry tons of concentrates produced in the company's 1,800-ton flotation plant. Net recoverable metal content of the 2,463 dry tons of concentrates and lime scale shipped was: Copper, 1,188,271 pounds; silver, 44,273 ounces; and gold, 2,029 ounces.

*Rich Bar district.*—The Virgilia Mining Corporation operated the Ohio Point quartz claim throughout 1938, and the value of its product was the largest in Plumas County; the ore was treated in the company

Digitized by Google

250-ton flotation mill, and the resulting concentrates were shipped for smelting. Lord & Bishop operated a dragline dredge with a 1½-cubic-yard excavator at Grays Flat from August 1 until the end of the year and produced 741 ounces of gold.

### RIVERSIDE COUNTY

*Chuckawalla district.*—The output at the Red Cloud lode property was the largest in the Chuckawalla district in 1938.

*Dale district.*—A number of small lode operations in 1938 were reported in the Riverside County part of the Dale district, but the principal producer of the district was across the line in San Bernardino County.

*Eagle Mountain district.*—The Imperial Smelting & Refining Co. worked the Black Eagle mine intermittently during 1938 and treated 2,025 tons of ore and 4,375 tons of old tailings in its 75-ton concentration mill to produce 247 tons of lead-copper concentrates; the concentrates contained 342 ounces of gold, 4,610 ounces of silver, 242,246 pounds of lead, and 18,616 pounds of copper.

*Pinacate district.*—The Ida Leona Mine & Milling Co. worked the Ida Leona mine throughout 1938. During the year the shaft was sunk from the 100- to the 200-foot level and some new machinery was installed on the surface; 1,297 tons of gold ore were treated to yield 868 ounces of gold and 254 ounces of silver.

### SACRAMENTO COUNTY

*Cosumnes River district.*—The Cosumnes Gold Dredging Co. operated a sixty-three 12-cubic-foot connected-bucket dredge throughout 1938 and handled 3,411,337 cubic yards of gravel, which yielded 11,018 ounces of gold. Lord & Bishop operated a dragline dredge from January 1 to July 7 and recovered 2,064 ounces of gold from 247,500 cubic yards of gravel.

*Folsom district.*—The Capital Dredging Co. operated three connected-bucket dredges throughout 1938 in the Folsom district; one had sixty-two 8½-cubic-foot buckets, another eighty-eight 18-cubic-foot buckets, and a third one hundred 18-cubic-foot buckets. The General Utility Corporation operated a washing plant and a 1½-cubic-yard dragline excavator until October 3; on October 27 the General Dredging Corporation took over the operation and continued it until the end of the year. The Gold Hill Dredging Co. produced a considerable quantity of gold from the clean-up of a dredge formerly operated in the Folsom district but moved during 1938 to the Ophir district in Placer County. The Natomas Co., the largest operator in Sacramento County, was working a fleet of seven electrically operated connected-bucket dredges in the Folsom district at the end of 1938. The number and size of buckets per dredge were: No. 1 dredge, sixty-two 16-cubic-foot buckets; No. 4, sixty-seven 15-cubic-foot buckets; No. 5, one hundred and five 12-cubic-foot buckets; No. 6, one hundred and six 11-cubic-foot buckets; No. 7, ninety-eight 9-cubic-foot buckets; No. 8, one hundred and five 12-cubic-foot buckets; and No. 10, eighty-three 15-cubic-foot buckets. The Hoosier Gulch Placers operated a dragline dredge 5 miles southeast of Sloughhouse throughout the year.

### SAN BERNARDINO COUNTY

*Buckeye district.*—The Bagdad Chase Extension Mining Syndicate conducted an extensive exploration campaign on the Butte Hill group and Roosevelt mine during 1938.

*Calico district.*—Most of the production from the Calico district in 1938 came from cyanidation of old tailings at the Old Barber, Silver King, Waterloo, and Zenda properties.

*Dale district.*—The Carlyle Mining Co. worked the Carlyle mine during 1938. The Gold Crown Mining Co., Ltd., largest producer in San Bernardino County in 1938, worked the Gold Crown group; during the year the company 50-ton cyanide plant was moved 6 miles from its former location in Riverside County into San Bernardino County.

*Halloran Springs district.*—Operation of the Lucky mine by E. Johnson and lessees in 1938 yielded 957 tons of gold ore, the larger part of which was shipped for smelting.

*Holcomb Valley district.*—The Holcomb Valley Placer Co. treated 8,000 cubic yards of gravel in 1938 to recover 103 ounces of gold between May 1 and December 20. The company operated a non-floating washing plant of the centrifugal bowl type, to which gravel was delivered by power shovel.

*Ivanpah district.*—The Colosseum Mining & Smelting Corporation worked the Colosseum mine during 1938.

*Old Woman Mountain district.*—Ore and old tailings were treated by amalgamation and concentration at the Valley View property in 1938. The Vulcan mine was active, and the ore mined was treated in an amalgamation-gravity concentration mill.

*Randsburg district.*—A large tonnage of gold-silver ore was shipped from the Kelly mine in 1938 for smelting.

### SAN FRANCISCO COUNTY

Almost 100 ounces of gold were credited to San Francisco County in 1938 in consequence of production by small-scale placer miners working the public Pacific Ocean beach sands near the San Mateo County line.

### SAN JOAQUIN COUNTY

*Linden district.*—A. G. Watkins & Sons operated a dragline dredge in the Linden district for a short period during 1938.

*Wallace district.*—The Wallace Dredging Co., which operated principally in Calaveras County in 1938, treated a small quantity of gravel when it worked for a short period across the line in San Joaquin County. Another operation on the county line, that on the K. D. Winship Estate property, recovered a substantial quantity of gold by dragline dredging in San Joaquin County.

### SAN LUIS OBISPO COUNTY

*Oro Fino district.*—F. H. Gates, Inc., recovered 215 ounces of gold between January 1 and May 26, 1938, as a byproduct of cleaning sand and gravel for highway construction. The auriferous gravel was mined on Oro Fino Canyon, a tributary of San Antonio River.

Digitized by Google

### SHASTA COUNTY

*French Gulch district.*—Ore from the Miners Group of mines, active from September until the end of the year, was treated in a 25-ton flotation mill installed during 1938. The J. H. Scott Co. worked the Washington mine, treated 2,901 tons of ore by amalgamation and flotation, shipped 30 tons of ore for direct smelting, and recovered, in all, 1,633 ounces of gold and 422 ounces of silver. A plant, having a 50-ton rod mill, pulsating jigs, and flotation equipment, was constructed during 1938 by the company.

*Igo district.*—The area southwest of Redding, which includes the towns of Igo, Ono, Gas Point, and Cottonwood, was the scene of numerous placer operations in 1938, most of which employed dragline dredges. Cinco Mineros operated a dragline dredge using a 1½-cubic yard excavator during the last 3 months of the year. Carlson & Sandburg operated two dragline dredges during part of the year. The Pioneer Dredging Co. worked two dragline dredges on Dry Creek throughout 1938; one of the outfits was powered entirely by electricity and handled 1,356,870 cubic yards of gravel. The El Oro Dredging Co. operated a dragline excavator equipped with a 1½-cubic yard bucket. R. S. Olson operated a dragline dredge from April until the end of the year. A dragline dredge of the Pilot Dredging Co. worked intermittently on a placer property 6 miles south of Redding. Piombo Bros. & Co. operated a dragline dredge and a 1½-cubic yard bucket on Clear Creek intermittently from July 1 until the end of 1938. The Red Hill property on Olney Creek was worked with a dry-land dredge using a dragline excavator from October 3 until the end of the year. The Roaring River Gold Dredging Co. operated the only dredge of the connected-bucket type in Shasta County on its property on Roaring River; the dredge carried seventy-two 3-cubic foot buckets. During the early months of 1938 the Gold Acres Dredging Co. operated a dragline dredge, equipped with jigs, on the Thibaut Ranch.

*Iron Mountain district.*—The Mountain Copper Co., Ltd., largest mining operation in Shasta County, worked its Iron Mountain property throughout 1938. All the material mined was treated by cyanidation, one-third going to the countercurrent decantation plant and two-thirds to the sand-leaching plant.

*Old Diggings district.*—During February 1938 the Star Gulch Mining Co. turned over management of the Walker mine to the Stewart-Brown Co., which operated the property until October 10. Fourells Dredging Co. worked a section of Churn Creek 4 miles east of Redding from April 26 to May 25 by dragline dredging.

*Redding district.*—Larson Bros. constructed an 18- to 24-ton amalgamation plant on the Blue Gravel mine and treated a considerable tonnage of ore during 1938.

### SIERRA COUNTY

*Alleghany district.*—Gamble & Wilson operated the Kenton mine throughout 1938 and treated a considerable tonnage of ore by amalgamation and cyanidation in its 30-ton 10-stamp mill. Original Sixteen to One Mine, Inc., leading producer in Sierra County, worked the Sixteen to One and Tightner mines throughout the year;

Digitized by Google

development work done totaled 2,300 feet. On April 1, O'Brien Mines, Inc., succeeded Socorro Mines, Inc., as operator of the Plumbago mine. During the year 9,753 tons of ore were treated by amalgamation and cyanidation and yielded 2,995 ounces of gold as bullion and 663 ounces by the smelting of concentrates. Development work included 557 feet of drifting, 593 feet of raising, 103 feet of sinking, and 881 feet of diamond drilling. The Kanaka Corporation abandoned its operations with a dragline dredge on Kanaka Creek 3 miles below Alleghany after working from April through July. The Lone Wolf and Gold Band claims yielded 195 ounces of gold from 7,000 cubic yards of gravel treated by hydraulicking. The Ruby mine 3½ miles southeast of Goodyears Bar was operated as a drift mine during 1938.

*Depot Hill district.*—The Depot Hill mine was worked by hydraulicking from the first of 1938 until July 14.

*Downieville district.*—The Tombstone Development Co. treated 5,000 tons of gold ore at the Bigelow mill during operations in 1938 that lasted from June until the end of the year; 815 ounces of gold and 412 ounces of silver were recovered. The Golden Bear Mines, Ltd., worked the Golden Bear drift mine.

### SISKIYOU COUNTY

*Callahan district.*—The connected-bucket dredge operated by Yuba Consolidated Gold Fields on Scott River near Callahan was the leading gold producer in the Callahan district in 1938; the dredge was equipped with seventy-two 9-cubic foot buckets.

*Greenhorn district.*—The Cal Oro Dredging Co. operated a dredge of the connected-bucket type from January 12 until the end of 1938 on the Tebbe property west of Yreka. A connected-bucket dredge with sixty-seven 6-cubic foot buckets, operated by the Yreka Gold Dredging Co., produced 10,957 ounces of gold and 1,522 ounces of silver from 1,558,069 cubic yards of gravel mined on ground 2 miles north of Yreka; this operation was the leading gold producer in Siskiyou County.

*Klamath River district.*—Klamath River has cut a deep channel many miles long through the gold-bearing mountains of Siskiyou County; many mines, most of them placers, are situated along its course. The majority of these operations are conducted on a very small scale and employ only hand methods. The St. Lawrence Mining Co., however, treated 90,000 cubic yards of gravel from the Reeves property in 1938 and recovered 812 ounces of gold by use of a stationary washing plant, to which gravel was delivered by carry-alls drawn by tractors. Drift-mining operations were reported at the Hoosier Hill placer on Klamath River. The Kookaburra Mines, Inc., operated a nonfloating washing plant to which gravel was delivered by high-line cableway using a ¾-cubic yard bucket. William von der Hellen Mines treated 32,000 cubic yards of gravel from McConnell Bar and recovered 517 ounces of gold between June 10 and August 21; this company used a stationary washing plant to which gravel was delivered by trucks loaded by a 1¼-cubic yard power shovel. Harms Bros. and Larsen Bros. began operations on Horse Creek on the Scandia mine December 1, 1938, and continued until the end of the year; a dragline dredge was used.

Digitized by Google

*Liberty district.*—The Gold Ball Mining Co. operated the Gold Ball mine during 1938. The King Solomon Mines Co., leading lode-mine operator in Siskiyou County, worked the King Solomon mine as an open-cut. George Tulare produced 230 ounces of gold by hydraulicking 8,000 cubic yards of gravel at the Joubert mine 2 miles from Sawyers Bar. The S. T. S. mine on Eddy's Gulch was the largest hydraulic operation in the Liberty district.

*Salmon River district.*—Lessees produced 108 ounces of gold from 105 tons of ore mined in 1938 at the Ida May and Francis Bell claims between June 8 and the end of the year. Hydraulic and small-scale hand methods contributed a substantial output of placer gold in the Salmon River district.

*Scott River district.*—The Frederica lode claim was active throughout 1938. Hydraulicking was carried on at the Roxbury property.

### STANISLAUS COUNTY

*Knights Ferry district.*—Carlson & Sandburg operated two dragline dredges in the vicinity of Wildcat Creek during 1938. On the Robuck property a washing plant, to which gravel was delivered by a dragline excavator, handled 10,000 yards of gravel during intermittent operations from October until the end of the year; 122 ounces of gold were recovered.

*La Grange district.*—The La Grange Gold Dredging Co., which operated a connected-bucket dredge throughout 1938, was the leading gold producer in Stanislaus County. The Tuolumne Gold Dredging Corporation began operations June 15 with a dredge of the connected-bucket type with one hundred and one 12-cubic foot buckets and continued until the end of the year.

### TEHAMA COUNTY

*Red Bluff district.*—The Midland Co. began operations with a dragline dredge on Sacramento River February 20, 1938, and continued to the end of the year.

### TRINITY COUNTY

*Big Bar district.*—A stationary washing plant to which gravel was delivered by a ¾-cubic yard dragline excavator was operated on the Pattison Ranch from January 15 to August 29, 1938.

*Hayfork district.*—The Hayfork Gold Dredging Co. operated a 1¼-cubic yard dragline excavator and floating washing plant near Hayfork during 1938.

*Helena district.*—In 1938 Al Hansen & Co. produced at the Enterprise mine 397 tons of ore, which was treated by amalgamation and flotation to recover 262 ounces of gold and 78 ounces of silver.

*Junction City district.*—Lessees on the Bergin mine hydraulicked 75,000 cubic yards of gravel in 1938 to recover 230 ounces of gold before their leases expired October 1. The property of Canyon Placers, Inc., was worked as a hydraulic mine from January 1 to June 10. The Junction City Mining Co. operated a connected-bucket dredge on Trinity River 1 mile above Junction City throughout the year. Lessees on the Red Hill mine hydraulicked a large quantity of gravel between the first of the year and July 1. The Golden Gravels

Digitized by Google

Mining Co. worked the Sourdough property with a 2-cubic yard dragline excavator and floating washing plant.

*Lewiston district.*—The Brown Bear Mines Corporation worked the Brown Bear mine during 1938. The dragline dredge operation on the Lowden Ranch was taken over by Interstate Mines, Inc., and was active from August until the end of the year; a 3-cubic yard excavator and 2½-cubic yard bucket were employed. On Trinity River near Lewiston the Lewiston Gold Dredging Co. operated a connected-bucket dredge with forty-six 8- and 9-cubic foot buckets throughout the year. The Trinity Dredge Co., after operating its connected-bucket dredge equipped with forty-two 11-cubic foot buckets from the first of the year until the end of October, leased it to T. D. and C. R. Harris, who continued the operation until the end of the year.

*Salyer district.*—Hydraulicking was carried on by the Swanson Mining Corporation on Trinity River and its South Fork from June 1 to 15, 1938.

*Weaverville district.*—Carlson & Sandburg continued their dragline dredge operation on Indian Creek near Douglas City during 1938. The General Utility Corporation operated a dragline dredge from November 1 until the end of the year; the equipment included a dragline excavator with one 1¼-cubic yard bucket. The Oro Trinity Dredging Co. worked a dragline dredge equipped with a 1½-cubic yard dragline. The Pioneer Dredging Co. began dragline operations in the Weaverville district in October and continued until the end of the year. The Viking Dredging Co. continued dragline dredging throughout 1938 on its property at the junction of Redding Creek and Trinity River; a floating washing plant and a dragline with a 2-cubic yard bucket were employed. The Weaver Dredging Co., the first dragline dredge operation in Trinity County, continued production throughout 1938; the company employed two plants. The Pacific Gold Dredging Co., operated a dragline dredge on West Weaver Creek from June 5 until August 21; the equipment consisted of a floating washing plant and a 1-cubic yard dragline bucket.

### TUOLUMNE COUNTY

*Columbia district.*—The Densmore Gold Mines, Inc., treated 1,570 tons of gold ore in its flotation mill in 1938 and shipped the concentrates for smelting; 2,001 ounces of gold and 975 ounces of silver were recovered. The Shoestring Mining Co. worked the Experimental group northeast of Sonora intermittently; 829 tons of ore yielded 121 ounces of gold by amalgamation and 8 ounces of gold by cyanidation of concentrates. The treatment of 1,370 tons of dump material at the National lode claim yielded 97 ounces of gold between September 16 and December 2. Operations at the Sugarman mine yielded 200 tons of ore, from which 228 ounces of gold were recovered during the period of operation from the first of the year to August 15.

*East Belt district.*—The Columbus Gold Mining Co. mined a large quantity of ore before ceasing operations in 1938. Metallic Mines produced 2,000 tons of gold ore during intermittent operations at the Longfellow mine. Lessees at the Mohrman Mine produced 475 tons of ore, from which 168 ounces of gold were recovered by amalgamation.

Digitized by Google

*Mother Lode district.*—Hemming Bros. treated 456 tons of ore by amalgamation and concentration and recovered 126 ounces of gold at the Alameda mine during 1938. Miller & Clemson worked the Eagle Shawmut mine from the first of the year until December 16. During the early months of the year surface ores were treated by cyanidation, but this work was abandoned because of poor recovery; the rest of the year, ore was treated in the company concentrating mill. In all 3,719 ounces of gold and 1,342 ounces of silver were recovered, principally by smelting of concentrates. Gold Diggers Syndicate worked the Heslep, App, Dutch, and Sweeney mines throughout 1938. The ore was treated in the company 50-ton flotation plant; 608 tons of concentrates were produced from 16,445 tons of ore and yielded 2,327 ounces of gold and 1,495 ounces of silver. E. A. Kent operated a dragline dredge on Tuolumne River, Woods Creek, and Curtis Creek. Moccasin Mine operated a dragline dredge on Moccasin Creek throughout 1938. Rim Cam Gold Dredging Co. operated a dredge, using a dragline with a 1-cubic yard bucket, on Woods Creek from April 17 to August 15.

### YUBA COUNTY

*Bear River district.*—Camp Far West Mining Co. suspended all operations at its property 5 miles east of Wheatland August 4, 1938; the company produced 250 ounces of gold from 16,000 yards of gravel, using a nonfloating washing plant to which gravel was delivered by a dragline excavator with ¾-cubic yard bucket.

*Browns Valley district.*—The Pennsylvania mine, operated by the Empire Star Mines Co., Ltd., was the outstanding lode producer in Yuba County in 1938.

*Challenge district.*—Operations at the Horseshoe mine in 1938 produced 1,830 tons of gold ore, which yielded 328 ounces of gold by amalgamation and concentration.

*Smartville district.*—A lessee on the Blue Point drift mine treated 4,688 tons of gravel to produce 267 ounces of gold during 1938. The Williams Bar Dredging Co. handled 2,872,621 cubic yards of gravel in its connected-bucket dredge during the full year's operations and recovered 8,582 ounces of gold and 629 ounces of silver. On Yuba River near Smartville was one of the largest camps of "snipers" in California during 1938; an average of 100 or more men camped along 2 miles of the river throughout the year.

*Yuba River district.*—Yuba Consolidated Gold Fields operated a fleet of five large electrically operated connected-bucket dredges in the Yuba River district throughout 1938, equipped as to number and capacity of buckets as follows: Eighty-seven 18-cubic foot, one hundred 18-cubic foot, one hundred and twenty-six 18-cubic foot, one hundred 18-cubic foot, and eighty-seven 18-cubic foot buckets. This company's operation was by far the largest in Yuba County and one of the largest single gold-producing operations in California.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN COLORADO

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 271 | Metallurgic industry | 279 |
| Calculation of value of metal production | 271 | Review by counties and districts | 284 |
| Mine production by counties | 275 | Golden Cycle mill | 292 |
| Mining industry | 278 | Leadville district | 296 |
| Ore classification | 278 | Cripple Creek district | 305 |

Colorado mines yielded gold, silver, copper, lead, and zinc valued, in terms of recovered metals, at $22,073,663 in 1938 compared with $22,107,207 in 1937. Gold, with no change in price during the 2 years and with only a very small difference in quantity produced each year (less than one-half of 1 percent decrease in 1938 from 1937), represented 58 percent of the total metal value in each year. The quantity of silver and copper produced increased 27 and 30 percent, respectively, in 1938 over 1937, but because of the lower average prices in 1938 the total value increased only 6 and 5 percent, respectively. Silver contributed 23 percent of the total metal value in 1938 and copper 13 percent. Lead production decreased 3 percent, and zinc increased 7 percent in quantity from 1937; lead, however, decreased 25 percent and zinc 21 percent in total value. Most of the principal producers in 1937 of gold, gold-silver, and silver ores and of base-metal ores mined because of their gold and silver content continued operations throughout 1938; and the number of small gold-mining enterprises increased. The output of zinc-lead-copper-silver-gold ore, however, was made almost entirely in the first half of the year, as the State's largest producer of zinc and lead in 1937 was shut down after June 1938, and only a small quantity of zinc, zinc-lead, and complex zincky ores was shipped from other mines in the State in the latter half of 1938.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

Digitized by Google

Annual figures for the 5 years ended with 1938, given in the table that follows, show a general upward trend in production over the period and large total gains for all five metals. Colorado has produced more silver in the past than any other State in the United States and ranks second in total recorded output of gold.

*Mine production of gold, silver, copper, lead, and zinc in Colorado, 1934–38, and total, 1858–1938, in terms of recovered metals*

| Year | Mines producing | | Ore sold or treated (short tons) | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|---|
| | Lode | Placer | | Fine ounces | Value | Fine ounces | Value |
| 1934 | 929 | 967 | 1,309,187 | 324,923.32 | $11,356,070 | 3,475,661 | $2,246,892 |

[1] Dragline and power-shovel excavators with sluices or special amalgamators.
[2] Figures for sluicing and hydraulic include those for drift mining.

*Gold.*—The principal gold-producing districts of Colorado in 1938, in order, were the Cripple Creek district, Teller County; Mosquito, Park County; Animas, San Juan County; Summitville, Rio Grande County; Empire, Clear Creek County; Redcliff, Eagle County; Upper San Miguel, San Miguel County; Gold Hill, Boulder County; Sneffels, Ouray County; and Leadville, Lake County. The three largest gold-producing properties in the State during the year were the United Gold Mines, Cresson, and Golden Cycle-Ajax, all in the Cripple Creek

Digitized by Google

district; the London mine in the Mosquito district ranked fourth, Summitville Consolidated Mines group at Summitville fifth, Shenandoah-Dives-Mayflower group at Silverton sixth, Minnesota Mines group at Empire seventh, Eagle mine at Gilman eighth, Smuggler Union group at Telluride ninth, and Camp Bird in Ouray tenth. Substantial gains in gold production were made in San Miguel, Eagle, Rio Grande, Ouray, Boulder, and San Juan Counties. The largest decreases from 1937 occurred in Park, Lake, Summit, La Plata, and Gilpin Counties. Dry and siliceous ores yielded 87 percent of the total gold; copper ore 5 percent; lead, lead-copper, zinc, and zinc-lead ores 3 percent; and placers 5 percent.

*Silver.*—Eagle County produced 67 percent of the State total output of silver in 1938 compared with 65 percent in 1937 and 63 percent in 1936. San Juan County continued in second place, and San Miguel County rose from fourth in 1937 to third in 1938. Mineral County ranked fourth, followed in order by Ouray, Pitkin, Clear

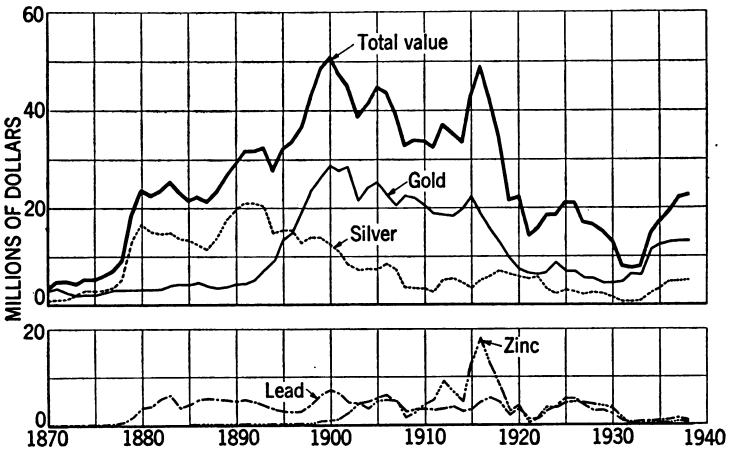

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1938. The value of copper has been less than $2,000,000 annually, except in a few years.

Creek, Saguache, and Lake. The chief silver-producing properties in 1938 were: Eagle mine group, Eagle County; Shenandoah-Dives-Mayflower and Sunnyside groups, San Juan County; Pittsburg-Last Chance-Del Monte group, Mineral County; and Smuggler Union and Butterfly groups, San Miguel County. Copper ore yielded 69 percent of the State total output of silver; dry and siliceous ore 26 percent; zinc-lead ore 3 percent; and other types of ore, together with a very small quantity from placer mines, 2 percent.

*Copper.*—In 1938 copper production in Colorado surpassed the previous record annual output of 1937 by 6,474,000 pounds and set a new record—28,342,000 pounds. Eagle County produced 85 percent of the State total in 1938 and San Juan County 7 percent; most of the remainder came from Saguache, Ouray, and Clear Creek Counties. The principal copper-producing companies were the New Jersey Zinc Co. Empire Zinc Division at Gilman, Shenandoah-Dives Mining Co. at Silverton, Rawley Mines at Bonanza, and Sunnyside Mining & Milling Co. at Eureka. Copper ore yielded 87 percent of the total

Digitized by Google

copper, dry and siliceous ores 10 percent, and other types of ore 3 percent.

*Lead.*—The output of lead in Colorado in 1938 decreased 3 percent in quantity and 25 percent in value from 1937. San Juan County produced nearly half of the State total in 1938; Lake, San Miguel, and Eagle Counties each produced more than 1,000,000 pounds. The Sunnyside mine in San Juan County was the largest individual producer of lead in the State during the year. Dry and siliceous ores yielded nearly 39 percent of the total lead, zinc-lead ores 33 percent, lead and lead-copper ores 18 percent, and copper ore 10 percent.

*Zinc.*—In the 5-year period from 1932 to 1936, inclusive, Colorado produced only 9,078,000 pounds of recoverable zinc, most of which was contained in zinc-lead sulfide ore shipped from Lake County to the pigment plant at Coffeyville, Kans.; in byproduct zinc concentrates derived from dry and siliceous silver ore from Pitkin County; and in zinc-lead-gold-silver-copper ore shipped from widely scattered districts to custom concentrators in Utah. In September 1937 the Sunnyside zinc-lead mine in San Juan County was reopened and was operated through June 1938, producing most of the State output of zinc in 1937 and 1938. No zinc-lead ore was shipped to Coffeyville from Lake County in 1938, but a few operators continued to ship zinc-lead-gold-silver-copper ores to Utah custom mills from Lake and other counties and the Midnight Mining Co. in Pitkin County continued to make byproduct zinc concentrates. In October 1938 the Shenandoah-Dives Mining Co., a large producer of dry and siliceous gold-silver ore containing some lead, copper, and zinc and a buyer of custom complex lead and zinc-lead ores for treatment in its mill, changed its treatment process from bulk lead flotation (with some zinc concentrates) to selective flotation and thereafter made flotation zinc, lead, and copper concentrates and table iron concentrates.

## MINING INDUSTRY

A study of the output of individual mines in Colorado in 1938 shows that 35 operations employing 25 to 460 men (totaling 3,384) produced 97 percent of the State output of copper, 93 percent of the zinc, 85 percent of the silver, 74 percent of the gold, and 73 percent of the lead. Compared with 1937 there was a decrease in 1938 of 14 in the number of lode mines employing 25 or more men. Six mines in this group that were active in 1937 suspended production before the end of that year; but one new operator appeared in the group in 1938, and nine continued operations but employed fewer men in 1938 than in 1937. The number employing less than 25 men in 1938, comprising the 9 mentioned above and others, including many small gold mines, prospects, and dumps worked by individuals and groups with a minimum of expense for equipment, increased from 606 in 1937 to 634 in 1938. Data on the total number of men working at the 634 small operations are not available, but the number is considerably larger relative to the quantity of metal produced than at the 35 large operations. Dry and siliceous gold, gold-silver, and silver ores comprised 76 percent of the State total output of ore in 1938; copper ore 17 percent; zinc-lead ore 6 percent; and other types of ore 1 percent.

Approximately 1,841,965 cubic yards of gravel were handled in 1938 by 2 floating connected-bucket dredges and 25 dry-land and dragline floating dredges; specific data on yardage handled at small-scale placer operations are not obtainable because of lack of knowledge by the operators of the quantity of gravel sluiced. Although there was some expansion in placer mining in 1938 resulting in the expenditure of money for equipment, the output of gold from placers amounted to only 5 percent of the State total, and none of the individual operators employed more than 24 men.

### ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in Colorado in 1938, with content in terms of recovered metals*

| Source | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|

## METALLURGIC INDUSTRY

The construction and maintenance of suitable ore-reduction mills and treatment plants have contributed materially to prolongation of the productive life of some of the old gold- and silver-producing districts of Colorado during the past few years. Many of the mines are situated in regions not reached by railroads or main highways, and it is necessary to make concentrated products containing the recoverable commercial metals in forms that can be transported economically to distant points and sold in the markets that offer the highest net return to the operator. Gold and silver recovered as amalgam and retorted and bullion, nuggets, and grains containing 20 percent or more gold or gold and silver combined can be sold direct to the United States mints and assay offices where the total melting, refining, and handling charges average only about 17 cents per fine ounce of gold. For this reason a number of flotation mills use mat-lined launders, jigs, and corduroy blanket or burlap tables in the ball-mill classifier circuit or following the classifier to remove concentrates containing free gold and heavy sulfides for treatment in amalgam barrels or iron arrastre; however, some of the concentrates made in this manner are shipped to smelters. The percentage of the State total lode gold recovered by amalgamation rose from 17 percent in 1934 to 20 percent in 1938; that recovered by cyanidation from 37 to 41 percent; and that recovered in concentrates and from crude ore smelted decreased from 46 to 39 percent.

*Mine production of metals in Colorado in 1938, by methods of recovery, in terms of recovered metals*

| Method of recovery | Material treated | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|
| | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Ore and concentrates amalgamated [1] | 770,788 | 69,157.00 | 24,114 | | | |
| Ore, concentrates, sands, and slimes cyanided [2] | [3] 591,197 | 142,858.81 | 89,849 | | | |
| Concentrates smelted | 77,893 | 102,703.64 | 2,017,721 | 3,471,090 | 13,759,162 | 9,064,000 |
| Ore smelted | 377,320 | 34,707.55 | 5,797,161 | 24,870,910 | 5,150,838 | 42,000 |
| Placer [1] | | 18,041.00 | 3,250 | | | |
| Total, 1937 | | 367,468.00 | 7,932,095 | 28,342,000 | 18,910,000 | 9,106,000 |
| | | 368,905.00 | 6,260,693 | 21,868,000 | 19,572,000 | 8,494,000 |

[1] Quicksilver purchased (which is close to amount used) by amalgamation mills was 5,193 pounds. Placer mines used approximately 400 pounds.
[2] Cyanide (in terms of 96- to 98-percent NaCN) used was 769,920 pounds.
[3] Comprises 361,177 tons of sands and slimes from ore and iron concentrates first roasted and amalgamated, 195,013 tons of tailings from ore first floated, and 35,007 tons of combined flotation and table concentrates and crude ore cyanided direct.

Owing to changing sources of ore supply and the variance in character and grade of ore produced in different levels of some individual mines many problems in metallurgy occur, and changes in flow sheets of mills constantly are being made; some of the mills are dismantled and new ones built. The mills in operation in Colorado in 1938 varied greatly in size—61 having capacities ranging from 35 to 2,000 tons daily and 32 from 3 to 30 tons daily. Available data on the status of the 61 larger mills show that 11 were new mills that started operations during the year; 20 operated part of the year but were later shut down and were idle as the year ended; 6 were enlarged; and 24 re-

Digitized by Google

ported no change. All but 5 of the smaller mills were run intermittently, and only 7 treated more than 1,000 tons of ore during the year.

The total ore treated in 1938 by all mills in Colorado handling ores of gold, silver, copper, lead, and zinc was 1,615,755 tons, of which 1,004,840 tons were treated in company mills at mines; 524,177 tons by the Golden Cycle custom roast-amalgamation-cyanidation-flotation mill at Colorado Springs; and 86,738 tons by custom flotation mills in or near the mining districts (some of which also treated company ore included above), comprising the following: The Mining Associates mill at Salina, Boulder Ore Sampling Works at Boulder (ore reshipped to Golden Cycle mill), and Colorado Smelting & Refining Co. plant at Marshall, all in Boulder County; Hoosac, Humboldt, and Ruth mills in the Idaho Springs district, Dumont mill at Dumont, and Silver Leaf (Watrous) mill at Silver Plume, all in Clear Creek County; Bolen and Golden Gilpin mills in Gilpin County; First National and H. G. N. in the Leadville district, Lake County; Creede Mills, Inc., at Creede, Mineral County; W. C. H. mill at Bonanza, Saguache County; and Shenandoah-Dives mill in San Juan County. All the foregoing custom mills except the Shenandoah-Dives treated only gold, gold-silver, silver, or silver-lead-gold-copper ores. Zinc-lead ore containing gold and silver from Chaffee, Clear Creek, Dolores, Hinsdale, Lake, San Juan, and Summit Counties was shipped to custom mills at Midvale and Tooele, Utah.

Direct-smelting ores comprised 19 percent of the State total ore in 1938. The Arkansas Valley lead bullion-leady copper matte smelter at Leadville purchased most of the gold, gold-silver, silver, and gold-silver-lead-copper ores and concentrates shipped to smelters during the year; the remainder was shipped to smelters in other States, as follows: Zinc ore from Gunnison County to Coffeyville, Kans.; zinc concentrates from Lake, Pitkin, and San Juan Counties to Amarillo, Tex.; iron-copper-silver-gold ore from Eagle County, copper-gold-silver concentrates from Clear Creek County, copper-silver ore from Montrose County, and gold-silver-lead and gold-silver-lead-copper ores and concentrates from the San Juan region to Utah smelters; and copper-gold-silver concentrates from San Juan County to El Paso, Tex.

### ADAMS COUNTY

A sluice within the No. 10 gravel-washing plant of the Brannan Sand & Gravel Co. on Clear Creek north of Denver recovered gold as a byproduct in 1938. Individuals who, with one or two exceptions, engaged in placering along Clear Creek as a spare-time activity recovered many small lots of placer gold which they sold to dealers in Denver. Sluicing of stream gravel on the Russell ranch in sec. 14, T. 2 S., R. 68 W., sixth principal meridian, yielded 4.98 crude ounces of placer gold averaging 0.909 fine in gold and 0.044 fine in silver.

### ARAPAHOE COUNTY

In 1938 placer operations by individuals on Cherry and Dry Creeks and their tributaries southeast of Denver recovered small lots of gold dust and amalgam retorts, which were sold to dealers in Denver.

### BOULDER COUNTY

The principal market for Boulder County ores in 1938 continued to be the Golden Cycle mill at Colorado Springs and for concentrates the A. V. smelter at Leadville. Carey & Weldon reopened the Boulder Ore Sampling Works April 1 and to the end of the year purchased ore for reshipment to the Golden Cycle mill. The Colorado Smelting & Refining Co. custom mill built near Marshall in 1937 was operated for a few months in 1938 before being placed in the hands of a receiver. Boulder County, as usual, had more producing lode mine operations than any other county in the State; however, many of those counted are prospects and dumps, inactive mines under investigation, and others producing in general less than 25 tons of ore. Space does not permit mention of these operations in the following review by districts.

*Central (Jamestown) district.*—The Wano mine at Jamestown was the principal gold producer in the Central district in 1938 and was next to the largest individual producing mine in Boulder County; it was operated by the owner and several sets of split-check lessees, who shipped the ore to the Golden Cycle mill at Colorado Springs. The other producers of a car or more of ore in the district were the Gold Finch, Golden Age, Grouse, Rip Van Dam, and Smuggler.

*Gold Hill district.*—Slide Mines, Inc., operated its Slide-Klondike group of mines continuously in 1938 and was the largest producer of gold, silver, lead, and copper in Boulder County. The ore is treated in the company 70-ton mill, which uses both the gravity- and flotation-concentration processes. Free gold caught on burlap tables between the classifier and Wilfley tables was amalgamated and shipped to the Denver Mint. Most of the gold and silver and all the copper and lead recovered were contained in concentrates shipped to the Leadville smelter. Mining Associates, Inc., continued to purchase ore from operators in Boulder County for treatment in its custom flotation mill at Salina. The Ingram mine, operated by the company, supplied the largest individual tonnage to the mill. The company also operated the Sunshine mine under lease after September 10. Approximately 10,000 tons of low-grade ore were shipped from the King group in 1938; the ore produced from September to December was treated in the St. Joe mill at Valmont, and the remainder was sold to custom

Digitized by Google

plants. Among other producing mines and dumps in the Gold Hill district in 1938 were the American-Osceola, Black Bird-White Eagle group, Black Cloud, Buena Ventura, Cash, Cold Spring, Dead Medicine, Emancipation, Evans, Evening Star, Fisk, Golden Crown, Golden Harp, Grant, Hawkeye, J. O., Little Johnny, Melvina dump, Nil Desperandum, Pilot, Plow Boy, Richard, Richmond, Scotia, Sun & Moon, Tammany, and Washburn.

*Grand Island district.*—The output from the Grand Island district in 1938 comprised ore shipped to custom plants from the Amy Paul mine, Bird's Nest-Village Belle group, Caribou, Cross group, Enterprise group, Huron claim, and Shirley group; ore concentrated by gravity in a 20-ton mill at the Norway mine; and a little gold recovered by placer miners on Beaver and South Boulder Creeks.

*Magnolia district.*—The American X, Ben C. Lowell, Cash-Rebecca, KeKeOnga, Senator Hill, Pickwick, Poorman, and Sac and Fox-Dunraven groups produced nearly all the ore shipped from the Magnolia district in 1938. The mill at the Keystone mine was repaired, and some ore was treated to test the equipment.

*Sugar Loaf district.*—In 1938 the Poorman group, worked by lessees, continued to be the largest producer of gold in the Sugar Loaf district. Most of the ore was shipped to the Golden Cycle mill. Lessees at the Grand Republic mine shipped 1,550 tons of ore to custom plants, chiefly to the Mining Associates mill at Salina. The other principal producing mines and dumps in the district were the Alpine Horn, Concord, Dime, Dolly Varden, Empress, Herold, Livingston, Logan, Nancy, Recluse, Red Signe, Three Brothers, and Wood Mountain. Ore from the Orphan Boy mine was treated in a small mill above Wallstreet, run for a period in 1938. A dragline and sluicing plant operated on the Giggy placer produced nearly all the district output of placer gold.

*Ward district.*—The B & M mine was the principal producer in the Ward district in 1938. It was operated under a lease from January 1 to November 15 by Larson & Johnson, who shipped 460 tons of ore containing 610 ounces of gold and 723 ounces of silver. These operators sank a shaft 83 feet and drove 250 feet of drifts. The lease was then transferred to Kissell & Co., who continued production and development to the end of the year. The Brock No. 5, Golden Queen, and Boston mines and the Humboldt and Grandview dumps produced nearly all the remainder of the district output.

## CHAFFEE COUNTY

*Chalk Creek district (Romley, St. Elmo).*—Lessees working the Mary Murphy mine on a small scale continued in 1938 to ship ore containing gold, silver, lead, and copper and a relatively high percentage of zinc to the Midvale (Utah) custom milling plant and selected ore of similar type, but lower in zinc content, to the Leadville (Colo.) smelter.

*Granite district.*—Only a few lots of ore were shipped from lode mines and prospects in the Granite district of Chaffee County in 1938. Two placer mines in Lost Canyon—the Independent and Lost Canon—each worked with a dragline and land washing and sluicing plant produced most of the placer gold shipped from the district during the year. Individuals recovered small lots of placer dust by sluicing along Arkansas River and Cache Creek.

Digitized by Google

*Monarch district.*—The quantity of lead-silver-gold ore shipped to the Leadville smelter in 1938 from mines in the Monarch district increased over 1937. The Lilly mine, which produced most of the ore, was operated by lessees nearly all the year. Several shipments were made from the Christmas of '98, Garfield, and New York claims. The Hawkeye mine, under development from September 1 to December 31, yielded 10 tons of ore.

*Riverside district.*—The Doris Ruby Mining Co. shipped 12 tons of gold-silver-lead ore to the Leadville smelter in 1938.

*Trout Creek district.*—A little gold was recovered by hand methods at the Mizpah claim, on which 54 feet of development work were done in 1938.

### CLEAR CREEK COUNTY

*Alice district* (*Yankee, Lincoln*).—The American Smelting & Refining Co., which had operated the Alice group since March 4, 1936, continued operations in 1938 to October 22, when it closed the mine and 275-ton amalgamation-flotation mill indefinitely, owing to exhaustion of ore. In 1938, as in 1937, this mine was the second-largest producer of gold and the largest producer of copper in Clear Creek County. Ore mined by Gopher State Gold, Inc., lessees of the Ottawa group, was concentrated in the Hoosac mill near the junction of Fall River and Clear Creek. The Reynolds stamp-amalgamation mill was run for a short period in 1938 on ore from the Reynolds group. Ore was shipped to the Golden Cycle mill from the Gold King and Lombard mines, and a small lot was shipped to the Leadville smelter from the Ivan group.

*Argentine district.*—The upper levels of the Santiago mine were operated in 1938 by a lessee who shipped the ore to custom plants. The Dynamite Metals Co. operated the mill at the mine under lease from May 26 to June 12 on dump material and then gave up its lease. The Santiago Metals Corporation afterward ran the mill for 70 days on ore obtained mostly from the dump. Lessees operated the Sidney Tunnel group of the New East Argentine Mining & Milling Co. 4 months and produced 570 tons of silver-lead ore which were treated by Bennett & Rowe in the Silver Leaf mill at Silver Plume and 2 tons which were shipped direct to the Leadville smelter.

*Empire district.*—Minnesota Mines, Inc., the largest producer of gold in Clear Creek County in 1938, operated continuously its consolidated group of claims in the area north of Empire. The ore was treated in the 250-ton mill at the mine by concentration on mats in launders and flotation followed by cyanidation of the flotation concentrates. After being treated the flotation concentrates, containing chiefly iron sulfide, were sold to the General Chemical Co. of Denver. The mat concentrates, containing mostly free gold, were amalgamated. Lessees at the Tenth Legion-Gold Dirt-Sprankel-Empress Tunnel group shipped over 1,000 tons of ore, part of which was sold to the Golden Cycle mill at Colorado Springs and part concentrated in custom mills at Dumont and Idaho Springs. The Viking Gold Mines Corporation, lessee of the Conqueror group, subleased the property to Three Leasers, who operated it from July 15 to December 31 and made steady shipments of ore to the Golden Cycle mill. The other producers in the Empire district in 1938

Digitized by Google

comprised the Bard Creek dump, Gold Bug mine, Gold Fissure, Mint, Omaha, Pittsburg, and Sturm.

*Griffith (Georgetown-Silver Plume) district.*—The H. G. Venable Co. reopened the Pulaski mine in July 1938 and operated it to the end of the year. The company drove 500 feet of drifts and raises, retimbered 400 feet of tunnel, and installed new rails for tramming. The output of ore (2,189 tons) was concentrated in the Silver Leaf custom mill at Silver Plume and the leased Commonwealth mill at Georgetown. During the first few months of the year the Commonwealth mill was used by the Griffith Leasing Co. to treat ore from the Griffith mine, which was closed later. Ore from the Corry City, Seven Thirty, and Wisconsin dumps was concentrated in the Silver Leaf mill and in the Ruth custom mill at Idaho Springs. Late in the year ore from the Capital Tunnel was shipped to the Ruth mill. A few lots of ore were shipped from other mines and prospects in the Griffith district, including the Johnny Bull, Mineral Chief, and Rio Grande. The Silver Plume Mining & Milling Co. remodeled the Terrible mill and repaired the tunnel portal between the mine and mill.

*Idaho Springs district.*—In 1938 the Alma-Lincoln Mining Co. treated 31,295 tons of gold-silver-lead-copper ore from its Elliott Barber-Lincoln group in its flotation mill. The company has been a consistent producer since October 18, 1933, in spite of having had serious difficulty in the disposal of tailings during the past 3 years. The Ruth custom mill continued operations on ores received from both Clear Creek and Gilpin Counties. The Humboldt Consolidated Mining Co. operated the flotation mill at the Clear Creek-Gilpin sampler on company and custom ore from January to April, when the company closed the mill and the Lord Byron mine; both remained idle to the end of 1938. Ore from the Dixie mine on Ute Creek was treated in a small amalgamation mill. The Colorado Custom Ore Millers treated ore from the Cardigan mine before suspending operations April 15. J. B. Furstenberg operated the Metropolitan mine and Hoosac mill under lease and treated 882 tons of his ore and 3,736 tons of custom ore from the other mines in Clear Creek County. The Black Eagle group and 60-ton flotation mill were operated for a short period early in the year. Ore was shipped to the Golden Cycle mill, A. V. smelter, Midvale (Utah) custom mill, and local custom mills from many other mines, prospects, and dumps in the Idaho Springs district, including the Bald Eagle mine, Calvin-Remington, Cardigan, Cardwell, Columbia-Summit, Crown Point-Virginia, Edward-Kunegunde, Golden Edge, Idaho Bride, Kangaroo, Red Jacket, Shafter, Stanley, Stephens Placer, and West Gold. Small sluicing operations along Clear Creek yielded placer gold.

*Montana district (Lawson, Dumont).*—The Clear Creek Consolidated Mining Co. erected a 150-ton flotation mill in 1938 at the portal of Clear Creek-Gilpin Tunnel to treat ore opened by the company development program carried on since 1936 in a group of claims traversed by the adit. The mill was started in June and was operated the rest of the year. The Dumont mill was used to concentrate some custom ore from the Gold Dirt group (Empire district), Jumbo claim (Idaho Springs district), and Santiago group (Argentine district), in addition to the output from the Phoenix mine (Trail district). Development work was done at the Red Elephant group, and some ore was shipped. Ore was shipped to custom plants from the Ameri-

Digitized by Google

can Sisters dump, Eagle millsite, Franklin D., Golden Nest, Kaverne, Yankee, and other properties in the Montana district.

*Trail Creek district.*—Mining Associates, Inc., operated the Freeland group of mines continuously in 1938. The ore was concentrated by combined gravity and flotation in the mill at the mouth of the McClelland Tunnel near Dumont. The Phoenix Trail Mining Co. operated the Phoenix mine 182 days in 1938; the ore produced was concentrated in the Dumont mill. Lessees at the Lamartine group produced a substantial tonnage of gold-silver-lead ore, part of which was concentrated in local custom mills and part shipped direct to the Golden Cycle mill and the A. V. smelter. They also shipped a car of zinc-gold-lead-silver ore to the custom concentrator at Midvale, Utah. Ore from the Donaldson (Wheatland)-Little Champion, Lone Tree, Mendic, and Oneida-Stagg groups was shipped to the Golden Cycle mill and the Ruth mill.

### CONEJOS COUNTY

In 1938 Stunner Mines, Inc., built a mill at the Eurydice group at Stunner 43 miles southwest of Monte Vista and operated it 6 weeks on ore from the Eurydice dump. The equipment of the mill consists of a jaw crusher, 4- by 4-foot ball mill, jig, table, classifier, and four-cell flotation machine. The mine shaft was unwatered to a depth of 300 feet, and some of the drifts were cleaned out and retimbered.

### COSTILLA COUNTY

*Grayback district.*—A watchman at the property of the Drum Estate produced placer gold by sluicing gravel in Grayback Gulch during the summer of 1938. A little gold was recovered from the Griffith placer.

### CUSTER COUNTY

*Hardscrabble district (Westcliffe, Silver Cliff).*—Shore, Kettle, Henning, & Stroehlke operated their 10-ton cyanide plant at Silver Cliff a few months in 1938 on material trucked from a tailings dump on the Nemaha-William property. Gold-silver precipitates produced were shipped to the Midvale (Utah) refinery. Smelting ore was shipped from the Defender and Little Annie claims.

### DENVER COUNTY

A few of the individuals who tried sluicing on Platte River and Cherry Creek in Denver in 1938 recovered a little gold.

### DOLORES COUNTY

*Lone Cone district (Dunton).*—The Modern Gold Mines, Inc., continued development of the Emma mine for several months in 1938 and made a test run in the mill, using 165 tons of ore. The concentrates produced and a little crude ore were shipped to the Leadville smelter.

*Pioneer district (Rico).*—The output from the Pioneer district in 1938 comprised 220 tons of zinc-lead-silver ore shipped to custom flotation plants and smelters in Utah from the Pro Patria group, Nora Lilly claim, and Rico Townsite, all worked by lessees. The

Digitized by Google

Rico Argentine Mining Co. carried on development work at its property and late in the year constructed a 150-ton selective flotation mill equipped to make three products—lead concentrates, zinc concentrates, and copper-iron concentrates; however, production was not begun in 1938. The mine was an important producer of zinc, lead, silver, and copper prior to 1931. The St. Louis Smelting & Refining Co. continued developing its property. A little placer gold was recovered by individuals sluicing on Dolores River.

### DOUGLAS COUNTY

Intermittent small-scale placer mining in 1938 on Cherry and Dry Creeks and Newlin and Russellville Gulches near Parker and Franktown resulted in the recovery of many small lots of gold dust that were sold to dealers in Denver.

### EAGLE COUNTY

*Burns and McCoy district.*—Placer gold was produced by sluicing on the Colorado River near Burns.

*Holy Cross district.*—The Hunky Dory claim was worked on a small scale from July 1 to November 1, 1938. Part of the ore produced was treated in a small stamp-amalgamation mill on the property, and part was shipped to other plants for testing.

*Red Cliff district (Battle Mountain).*—The Empire Zinc Co., subsidiary (changed July 1, 1938, to Division) of the New Jersey Zinc Co., operated its Eagle mine group at Gilman continuously in 1938. The mine has been an annual producer since the company began developing it in 1912. In 1929 a 600-ton underground flotation mill was built and placed in operation, and in 1930 the mine was the principal producer of silver, copper, and zinc in Colorado and an important producer of lead and gold. Mining of zinc-lead ore was suspended in 1931, and the mill was closed and has remained idle through 1938. From 1931 to 1938, inclusive, the mine has continued to be the State's largest producer of silver and copper and a substantial producer of gold from copper-iron-silver-gold sulfide ore shipped to smelters, mostly to the copper smelter at Garfield, Utah. This ore contains comparatively small quantities of lead and zinc; some of the lead is recovered, but none of the zinc is saved. The output from other mines in the Red Cliff district during the year comprised gold-silver-copper ore shipped to smelters from the Alpine, Ben Butler, Cora, Evening Star, Ground Hog, Star of the West, and Tip Top properties and a 2-ton lot of gold ore shipped to a smelter from a prospect.

### ELBERT COUNTY

Individuals sluicing at small placers near Elizabeth recovered placer gold in 1938.

### EL PASO COUNTY

#### GOLDEN CYCLE MILL

The Golden Cycle custom mill at Colorado Springs ranked fourth among producers of gold in the United States (including Alaska) in 1937. In 1938 it treated 524,177 tons of ore having an average gross value of $10.83 per ton, of which 480,105 tons were gold-[silver]-

Digitized by Google

sulfotelluride ores from the Cripple Creek district, Teller County, and 44,072 tons comprised miscellaneous gold, gold-silver, and gold-silver-lead-copper ores from other districts, mainly in Boulder, Clear Creek, Gilpin, and Lake Counties. The mill, built in 1907 as a 1,200-ton roast-amalgamation-cyanidation plant, has been operated continuously ever since and has been enlarged to make use of the flotation- and gravity-concentration processes in handling low-grade Cripple Creek ores and miscellaneous ores containing base metals. In 1938, as usual, average-grade Cripple Creek ores comprised most of the mill feed. These ores, with which were mixed iron concentrates made from low-grade ores, were roasted, amalgamated,[1] and cyanided. Miscellaneous ores containing appreciable quantities of base metals were treated by selective flotation. The tailings from all operations were separated into sand and slime fractions and cyanided. The mill recovered 99 percent of its total gold output in the form of gold-silver bullion; the remaining 1 percent was contained in lead-copper concentrates shipped to the Leadville smelter. Equipment for firing the roasters with pulverized coal was installed in 1937. Improvements made in 1938 included the installation of a large crusher to replace a smaller one in the primary crushing plant and the placing of screens ahead of the jaw crusher and Symons cone crushers, which, with changes in the secondary crushing equipment, raised the capacity of these units and reduced the number of daily shifts necessary for the crushers to run. The more efficient crushing equipment furnished finer material to the ball mills in the concentration department and raised the capacity of this section from 450 to 550 tons daily. Economies effected by these improvements and those made in other departments of the mill during the past few years enabled the management to try to stimulate development work and prolong the productive life of the Cripple Creek district by a revision, effective December 1, of the mill schedule of gold payments and treatment and freight rates designed to increase the revenue to the shipper by approximately 40 cents per ton on ore having a gross value of $5 a ton and ranging up to $1.15 per ton on ore valued at $11.30 a ton.

### FREMONT COUNTY

A car of copper ore each was shipped from the Green Mountain and the Copper Gulch Mining Co. properties near Parkdale to the Garfield (Utah) smelter in 1938. A little placer gold was recovered by sluicing at the old Dorcas millsite at Florence.

### GARFIELD COUNTY

*Rifle Creek district.*—A lessee worked the Gray Eagle mine 8½ miles north of New Castle during the last 6 months of 1938 and shipped to smelters 103 tons of gold sulfide ore containing a little silver and copper. The development work done comprised a 60-foot winze, 50 feet of drifting, and 30 feet of raising.

### GILPIN COUNTY

*Southern districts (Blackhawk, Central City, Nevadaville, Russell Gulch).*—Production of metals in 1938 from lode mines in the southern

[1] Free gold saved on lightweight canton-flannel blankets and amalgamated in iron arrastre.

Digitized by Google

districts of Gilpin County declined from 1937, owing to the shutdown after February of "The Patch" property and large Chain O'Mines mill at Central City and the idleness nearly all the year of the Bobtail Tunnel group and Gregory-Bates mill at Blackhawk, active throughout 1937. In 1938 the Gold Ridge Mining Co. did 1,000 feet of drifting at the Clay County group and erected a 75-ton flotation mill. The mill began treating ore in August and continued in operation to the end of the year. During the year the Gunnell, Corydon, Phoenix, Huddleston, and Buell claims in the consolidated group owned by the California-Hidden Treasure Mines Co. produced a total of 993 tons of ore, which yielded 215 ounces of gold and 740 ounces of silver. In addition, 13,000 cubic yards of placer gravel on the Buell claim, handled by a power shovel and screening and sluicing plant on skids, yielded 214 fine ounces of gold and 42 fine ounces of silver. A 15-ton stamp amalgamation-table concentration mill was run throughout the year at the New Brunswick mine. Colorado Silver Mines, Inc., ran its 100-ton flotation mill intermittently on ore from the Black Jack group. The Golden Gilpin custom mill at Blackhawk was operated for a few weeks, mostly on material obtained from dumps. The War Dance mill was reconditioned and was run about 30 days on ore from the Crown Point mine in Clear Creek County. The Big Four Mining & Milling Co. treated ore from the Kirk mine for a period after August in the remodeled Bolen mill. The mine was operated earlier in the year by Raoul Mines, Inc., which shipped ore to other custom plants. Small-scale mining carried on all or part of the year at the following mines and dumps resulted in the shipment of ore to custom mills, chiefly the Golden Cycle mill at Colorado Springs: Becky Sharpe, Columbus-Lotus, Druid, Federal, Frontenac, Golden Cloud, Golden Dollar, Iowa, Justice, Morning Star, Pewabic group, Robert Fulton, Snowden, Stewart, Wautauga dump, West Notoway, and others.

The Manion Placer Co. operated its dragline and land dredge on the Eugene placer on North Clear Creek below Blackhawk 186 days in 1938 and was the largest producer of gold in Gilpin County during the year. Placer ground on the Missions Mines Co. property in Russell Gulch was worked from March to December with a ½-cubic-yard dragline and sluices. Small sluicing operations were carried on by many individuals in the vicinity of Blackhawk and Central City and on North Clear Creek below Blackhawk.

*Northern districts.*—The Dirigo Mining Co. operated the Dirigo mine and amalgamation-flotation mill through most of 1938. The Tip Top Mines, Inc., worked the Perigo group under lease part of the year and treated some ore in the mill at the mine. Ore was shipped to the Golden Cycle mill from the Lone Star, Martha, Mitchell, Newport, Semiprone, and other properties. The Gilpin County Gold Mining Corporation ceased production early in the year at the We Got Em and Cowboy group at the head of Silver Creek. The Cooley Gravel Co. worked the Pactolus placer near Pinecliff with a rated 2,000- to 2,500-cubic-yard floating dredge fed by a 1½-cubic-yard dragline for its second season, which lasted from April 10 to December 13. The yield from 419,958 cubic yards of gravel handled was 3,166 fine ounces of gold and 279 fine ounces of silver. F. R. Wolfe operated a dragline excavator and special land sluicing plant in Lump Gulch from April 15 to June 20 and recovered 63 fine ounces of gold. Small sluicing operations in Gamble and Lump Gulches yielded some gold.

Digitized by Google

### GRAND COUNTY

Prospectors sluicing on Bronco Creek and Colorado River recovered a little gold in 1938.

### GUNNISON COUNTY

*Box Canyon district.*—A lessee at the Independent mine, 6 miles south of Pitkin, erected a mill consisting of a crusher, four rapid-drop stamps, amalgamation plates, and launders in which he treated 225 tons of ore in 1938 and recovered 19.60 fine ounces of gold and 3 fine ounces of silver.

*Elk Mountain district.*—Some development work was done and a 10-ton gravity-concentration mill installed in 1938 at the Baxter property. The only metal produced was contained in 1.3 tons of gold-silver-lead concentrates made from 25 tons of ore run through the mill for testing. A car of smelting ore was shipped from another property in the Elk Mountain district, and a little gold was recovered from a placer in Washington Gulch.

*Gold Brick district.*—The Carter Mines Co. continued production in 1938 from the Carter mine and mill on Gold Creek. The mine is opened by an 8,800-foot adit, a 1,200-foot, vertical, four-compartment raise, and numerous drifts. Water from Gold Creek furnishes power to run the mill, which has a capacity of 125 tons daily and treats the ore by amalgamation and gravity concentration. The Old Tom Mining Co. treated 150 tons of ore from the Cortland group in the leased Roosevelt mill near Pitkin early in 1938 and also shipped some ore to smelters. Operations were discontinued after April 15 and the company gave up its lease on the mine. A car of gold-silver-lead ore was shipped to the Leadville smelter from the Bertha mine. A little gold was recovered by amalgamation at the Idoline, Wayne, and one other property in the Gold Brick district.

*Quartz Creek district.*—Lessees at the Fairview group shipped 46 tons of silver-lead-gold ore to the Leadville smelter in 1938.

*Spring Gulch district.*—A lessee at the Doctor group shipped 93 tons of zinc carbonate ore early in 1938 to the Ozark Smelting & Mining Co. pigment plant at Coffeyville, Kans.

*Taylor Park (Tin Cup) district.*—Ore treated in a small mill at the Red Buck-Trail Horse group of lode claims yielded a few ounces of gold in 1938. Individuals sluicing on Willow Creek and other streams in Taylor Park recovered small quantities of placer gold.

### HINSDALE COUNTY

*Galena district.*—The M. B. Burke Investment Co. operated its flotation mill in 1938 at the Ute and Ulay group on Henson Creek from June 15 through November. Material containing zinc, lead, gold, silver, and copper was shipped from the Mill Placer to the custom concentrator at Midvale, Utah. Twelve tons of silver-lead ore from a stope in the California mine were trucked to the Leadville smelter.

*Lake district.*—In 1938 the Ramsey Brothers Gold Mining & Milling Co. treated 100 tons of silver-lead-gold-copper ore from the Gladiator mine by gravity concentration; the yield was 12 tons of concentrates, sold to the Leadville smelter.

159434—39——20

### JACKSON COUNTY

A placer miner recovered a little gold on Independence Mountain northwest of Walden in 1938.

### JEFFERSON COUNTY

Individuals continued small-scale intermittent sluicing operations along Clear Creek in 1938 and produced many small lots of placer gold, which were sold to refiners, assayers, and the mint in Denver.

### LAKE COUNTY

#### LEADVILLE DISTRICT

Leadville continued to be the center of the smelting industry of Colorado in 1938. The American Smelting & Refining Co. operated its Arkansas Valley lead bullion-leady copper matte smelter continuously (one furnace) on ores and concentrates purchased from operators in virtually all the active mining districts of the State; receipts from Colorado totaled 107,335 tons compared with 122,235 tons in 1937. In 1938 small lots of ore from New Mexico and Wyoming and 82 tons of combined ore and concentrates from South Dakota were received.

Compared with 1937 the output of ore from lode mines and dumps in the Leadville district in 1938 decreased 74 percent, and the total value of the recovered gold, silver, copper, lead, and zinc decreased 55 percent. The 400-ton Leadville Metals mill, which in 1937 treated 124,457 tons of low-grade dump material containing chiefly gold but also some recoverable silver, copper, and lead, was closed February 2, 1938, and remained idle throughout the rest of the year. However, new mills placed in operation in 1938 by the London Deep Mines Co. at the First National shaft and the H. G. N. Mining & Milling Co. on the Henriett claim treated a total of 10,800 tons of material from dumps in the district. Low-grade ore was shipped from the Ballard, Breece, "Lilian", and President dumps to the Golden Cycle mill at Colorado Springs. Most of the output of newly mined ore and that sorted from dumps was sold direct to the A. V. smelter, but some was shipped to the Golden Cycle mill. No zinc-lead ore was shipped from the district to the pigment plant at Coffeyville, Kans., in 1938, and there was a large decrease from 1937 in the quantity of zinc-lead-gold-silver-copper ore shipped to the custom concentrator of the United States Smelting, Refining & Mining Co. at Midvale, Utah; the only important producer of this type of ore in 1938 was the Fortune mine. Lessees continued production of gold ore from the Ibex group. Some of the other producing mines and dumps in 1938 follow: Chippewa, Commerce, Dolly B, Eliza dump, El Paso dump, Fanny Rawlings, Highland Chief and Highland Mary, Iron Hat, Lilian (mine), Matchless, New Monarch, Ollie Reed, Little Ellen, St. Louis, Morning Star dump, Resurrection, Sunday dump, Tenderfoot, Tribune, Triumph, and Venir. Individuals sluicing in California Gulch recovered placer gold.

*Granite district.*—The output from the Lake County part of the Granite district in 1938 comprised gold, silver, and lead contained in ore and a small quantity of bullion shipped from the Belle of Granite mine and placer gold produced by individuals sluicing mostly on Arkansas River.

Digitized by Google

*Lackawanna Gulch district.*—The Eureka Saturday Night Mining Co. drove 400 feet of tunnel and raises at the Eureka-Saturday Night group in 1938 and erected a 50-ton jig- and flotation-concentration mill which was run during the latter half of the year. Some ore from the Mt. Champion group was treated in a mill installed on the property in 1938.

*St. Kevin-Sugar Loaf district.*—Edward P. Chapman shipped 111 tons of gold-silver ore to the Leadville smelter from the Amity mine, operated from June to December 1938. Several hundred tons of siliceous silver ore from the St. Kevin dump were hauled to the First National mill near Leadville and treated by flotation.

*Tenmile (Climax, Fremont Pass) district.*—The Climax Molybdenum Co. at Climax, 13 miles north of Leadville, operated its flotation mill at a daily average of 12,000 tons for 362 days in 1938 and produced concentrates containing 28,242,085 pounds of elemental molybdenum, the largest annual output in the history of the mine.

*Tennessee Pass district.*—A dragline-dry land dredge installed in the summer of 1938 on the Columbia placer in Tennessee Gulch about 5 miles north of Leadville was operated from July 1 to September 1 and handled 150,000 cubic yards of gravel yielding 563.02 ounces of retorts and grains, which after being melted at the Denver Mint weighed 470.95 ounces and averaged 0.888 fine in gold and 0.088 fine in silver.

*Twin Lakes district.*—Small lots of smelting ore were shipped from the Gordon-Tiger and Columbine lode claims in 1938. The dragline-dry land dredge on the Derry Ranch placers was operated from May to November.

### LA PLATA COUNTY

The American Smelting & Refining Co. lead bullion-leady copper matte smelter at Durango, which was closed November 30, 1930, remained idle in 1938.

*Animas River district.*—Testing of placer ground on Animas River north of Durango resulted in the recovery of a few ounces of gold in 1938.

*California (or La Plata) district (Hesperus, La Plata).*—Pioneer Gold Producers, Inc., operated the Idaho mine and mill from January 1 to April 8, 1938, after which both were idle to the end of the year. The property was sold to Consolidated Gold Producers, Inc., as of July 1, 1938, and the former operating company was dissolved. Lessees did some work at the May Day mine, equipped with a 50-ton flotation mill, and shipped small tonnages of crude ore to the Golden Cycle mill and concentrates to the Leadville smelter. A little ore was shipped from the Hazel M claim, Old Story, Tomahawk, and an unidentified claim. The Amparo Mining Co. ceased development work at the May Rose group.

### LARIMER COUNTY

Small lots of sorted high-grade gold ore were shipped in 1938 from the Little Mary Mason mine in the Masonville district to the Golden Cycle mill.

Digitized by Google

### MINERAL COUNTY

*Creede district.*—The local market for ore furnished throughout 1938 by the custom flotation mill of Creede Mills, Inc. (inadvertently called Creede Mines, Inc., in Minerals Yearbook, 1938, p. 271), stimulated production in the Creede district and resulted in an increase of 42 percent over 1937 in the district output of silver. In 1938 the company treated 35,179 tons of ore, of which about 70 percent was newly mined and 30 percent came from dumps. The heads into the mill averaged 0.006 ounce of gold and 18.2 ounces of silver to the ton and 1.35 percent lead. The ratio of concentration was 38 tons into 1, and the concentrates averaged 0.20 ounce of gold and 471 ounces of silver to the ton and 13.6 percent lead; they were shipped to the Leadville smelter. The following properties supplied the ore treated in 1938: Alpha-Corsair, Amethyst, Commodore-Bachelor, and New York-Last Chance-Del Monte-Pittsburg groups and Manitoba and Monon mines. Lessees working the Ochre mine shipped ore direct to the Leadville smelter.

### MOFFAT COUNTY

*Fourmile (or Timberlake) district.*—Eldorado Gold Placer Mines continued production in 1938 from its placer ground about 29 miles north of Craig, worked with a gasoline-powered dragline excavator and dry-land dredge. The season's operations lasted from May 14 to October 12. Sluicing at the Old Faithful, Sage Hen, and other placers in the Fourmile district recovered some gold.

### MONTEZUMA COUNTY

The Red Arrow Gold Corporation worked the Red Arrow mine in the East Mancos River area continuously in 1938. Production totaled 638 tons of ore yielding 1,744.08 fine ounces of gold, 3,447 fine ounces of silver, and 2,500 pounds of recoverable copper. The richest ore was crushed and amalgamated in a small mill at the mine, and the rest was shipped to smelters. The company did 1,000 feet of development work in the mine during the year. The Barr-Menefee Mining Co. drove 100 feet of tunnel at the Stafford group and shipped 21 tons of gold-silver-copper-lead ore to the Midvale (Utah) smelter. Gold-silver-copper ore was shipped from the Omaha Placers property, adjoining the Red Arrow group. A little gold was recovered from a placer claim on East Mancos River.

### MONTROSE COUNTY

*La Sal district.*—Lessees at the Cashin and Sunrise claims shipped 119 tons of copper-silver ore to the Garfield (Utah) smelter in 1938. Placer miners, with pumps and sluices, continued to recover placer gold on Dolores River.

*Naturita district.*—Small sluicing operations on San Miguel River recovered placer gold in 1938.

*Paradox Valley district.*—The United States Vanadium Corporation operated its vanadium mines and roasting and leaching plant at Uravan continuously in 1938, producing at the rate of 240 tons of ore daily and drawing at will the grade of ore desired. Production of the finished product was greater than in 1937. The company extracts its own salt in the vicinity and owns and operates its own coal mines.

Digitized by Google

### OURAY COUNTY

*Red Mountain district.*—San Juan Metals, Inc., operated the Treasury Tunnel group from January to October 1938, but production was interrupted for a few weeks in April when the blacksmith shop and some other buildings burned and had to be rebuilt. The ore was treated in the company 300-ton selective flotation mill. The product of the mill was copper concentrates and lead-copper concentrates, both of which contained gold and silver and some zinc. Although production ceased in October the company planned to continue the drift on the Handicap vein about 300 feet farther and then crosscut to the Barstow vein. Ore produced at the Meldrum-Hoffman group, under development by G. A. Franz, was treated in the G. A. Franz flotation mill 2 miles north of Ouray.

*Ridgway district.*—Small placer operations on Uncompahgre River near Ridgway produced placer gold in 1938.

*Sneffels district.*—King Lease, Inc., made an increased output over 1937 of gold-silver bullion and gold-silver-lead-copper concentrates from its amalgamation-flotation mill, run continuously in 1938 on ore from the Camp Bird mine. The capacity of the mill is 75 to 100 tons daily. The company extended its development and mining below the third level and started development (specified upon renewal of its lease) in the west heading of the lower adit level 1,450 feet below the third level. Sublessees at the Humboldt group near the line between San Miguel and Ouray Counties shipped a car of silver-gold-lead ore sorted from the dump to the Garfield (Utah) smelter. A little gold was recovered from 10 pounds of ore from the Alma claim reduced and amalgamated by hand.

*Uncompahgre district.*—A lessee on the property of the Bachelor Development Co. shipped several hundred tons of silver-lead ore to smelters in 1938. G. A. Franz treated ore from the Wedge and Bachelor dumps in his flotation mill from March 15 to May 25. A lessee at the Pony Express-Upper Bachelor group shipped silver-lead ore to the Leadville smelter. The McCullough Lease shipped gold-silver-copper ore to the Leadville smelter from the American Nettie, O & N, and Wanakah groups, worked as a unit, and treated 1,000 tons of old tailings from the Wanakah mill dump in a flotation mill on the property. Smelting ore was shipped from other properties in the Uncompahgre district under development in 1938, including the Mineral Farm, Ophir, and Senorita Extension groups.

### PARK COUNTY

*Alma Placers district.*—Lessees continued sluicing, drift mining, and power shovel operations on leased blocks of the Alma placers in 1938. Among the important producers were the Alplaco Mining Co., Logue, R & W, and Richards leases.

*Beaver Creek district.*—The Timberline Dredging Co. set up a connected-bucket electric-powered floating dredge with a capacity of 5,000 cubic yards daily on ground of the Placers Realty Co. on Beaver Creek 1½ miles north of Fairplay and began production October 25, 1938. The bucket line has 88 buckets, each with a capacity of 7½ cubic feet. Most of the machinery was obtained from the dismantled Continental dredge formerly in Summit County. The dredge was operated intermittently to December 16 and handled about 115,000

Digitized by Google

cubic yards of gravel, which yielded placer gold weighing 465.53 ounces after being melted at the Denver Mint and averaging 0.795 fine in gold and 0.175 fine in silver. Individuals recovered placer gold by sluicing and hydraulicking at the Shelton and other placers on upper Beaver Creek during the summer months.

*Buckskin district.*—Most of the metal output of the Buckskin district in 1938 was contained in gold-silver-lead ore shipped to the Leadville smelter by lessees at the Union No. 5 mine. The other producers were the Excelsior and Silver Wave groups, both equipped with small concentration mills; Phillips, under development throughout the year; and another property producing less than a ton of ore. A little gold was recovered from placers in Buckskin Gulch.

*Consolidated Montgomery district.*—Alma Syndicate, Inc., operated its cyanide mill on the Tolstoi claim on Mount Bross at an average daily rate of 52½ tons for 110 days in 1938 on gold-silver ore mined with a power shovel from open-cuts on the Morning Star group. The mine was operated from July 19 to November 19; 200 feet of development work were done underground, and 15,000 tons of surface material were stripped. Starting in October 1938 the Magnolia Gold Mining Co. remodeled the mill at the Magnolia mine and late in the year treated 150 tons of gold ore by flotation and gravity concentration. Some placering was done in Montgomery Gulch during the year.

*Fairplay district.*—Individuals continued to recover placer gold in 1938 by sluicing along Platte River west and south of Fairplay.

*Horseshoe district.*—The Cole Colorado Co. shipped 11 tons of silver-lead ore from the Peerless group to the Leadville smelter in 1938.

*Mosquito district.*—The output of gold from the Mosquito district in 1938 decreased 10,919 ounces (25 percent) from 1937. The London Mines & Milling Co., which ranked first among gold producers in the district and fourth in the State in both years, operated the consolidated London, London Extension, and "North London" groups through the 4,400-foot London Extension tunnel continuously in 1938. The ore was treated in the company 200-ton mill by combined gravity and flotation concentration. Besides gold, the flotation concentrates shipped contained some silver, a little copper, and substantial quantities of lead and zinc; the zinc was not saved at the Leadville smelter, to which the concentrates were sold. The London-Butte Gold Mines Co., the second-largest operator in the district, continued production from the Butte mine and 100-ton flotation mill. The mine workings are reached through a vertical shaft 512 feet deep. Development work done in 1938 totaled 2,763 feet. The yield from 20,737 tons of ore treated was 1,940 tons of concentrates averaging 2.96 ounces of gold and 1.67 ounces of silver to the ton, 4.50 percent lead (wet assay), and 2.22 percent zinc. W. A. Ellis, Inc., shipped high-grade gold ore from the American mine to the Leadville smelter. The Chicago Mines Co. treated 24,793 tons of ore from the South London dump in the Record mill. The concentrates produced averaged 3.35 ounces of gold to the ton and contained some recoverable silver and lead. Concentrates caught in launders and amalgamated in a barrel yielded 688 fine ounces of gold. Among other producers in the district in 1938, operated part of the year, were the Hock Hocking, Nova Zembla, Orphan Boy, and Susquehanna. Prospecting and testing were done at the Pennsylvania Mountain placer, which has yielded

Digitized by Google

some gold annually from intermittent small-scale operations during the past few years.

*Tarryall district.*—The Peerless Mining Co. operated its gasoline-powered 1¼-cubic yard shovel and portable Ainlay four-bowl washing machine for the fifth consecutive season on the Wilson placer 7 miles southeast of Como. In 1938 the plant was run from April 27 to November 3 and handled 79,135 cubic yards of gravel. Individuals sluicing on Tarryall Creek recovered small lots of placer gold. Examination including rechecking of extensive pits and churn-drill holes on the Fortune Placer, Peabody Placer, and Cline Ranch old river channels was done in 1938. Additional gold-bearing yardage was developed and adjacent property purchased.

### PITKIN COUNTY

*Lincoln Gulch district.*—A small lot of gold-silver ore was shipped to the Leadville smelter from the Three Brothers claim in 1938.

*Roaring Fork district (Aspen).*—Shipments of silver ore containing lead and lime to the Leadville smelter were continued in 1938 from the Smuggler and Spar Consolidated properties, both under the management of D. P. Rohlfing. The Midnight Mining Co. treated 5,000 tons of siliceous silver ore from the Midnight group in the company 50-ton flotation mill. The products of the mill were 238 tons of lead concentrates, averaging 256 ounces of silver to the ton and 54.6 percent lead (wet assay), shipped to the Leadville smelter; and 201 tons of byproduct zinc concentrates, averaging 20.5 ounces of silver to the ton, 1.5 percent lead (wet assay), and 47 percent zinc, shipped to the Amarillo (Tex.) zinc smelter. During the year the company sank a 50-foot winze and drifted 50 feet to cut the ore body below the level of the main 6,700-foot adit. The Metals Recovery Co. operated the Hunter Creek mill for a period in 1938 on dump material, mostly from the Franklyn mine dump. A car of smelting ore was shipped from the Hope mine.

### RIO GRANDE COUNTY

Summitville Consolidated Mines, Inc., operated its group of mines and mill at Summitville continuously in 1938. The mining and milling methods and costs at this property as of August 1937 have been described by Guiteras.[2] Extensive development of the property since 1934 has resulted in a steady annual increase in production, and in 1938 the company ranked fifth in the State in gold output. During the year the company discontinued use of the flotation machines and tables, installed a jig in the ball-mill circuit to remove a high-grade sulfide concentrate for shipment direct to the smelter, and then treated the remainder of the pulp by the all-slime cyanide process. The precipitates are smelted at the mine and the bullion produced is shipped to the Denver Mint. Lessees at the Guadalupe property at Jasper shipped a 15-ton lot of gold-silver ore to the Leadville smelter in 1938.

[2] Guiteras, Jos. R., Mining and Milling Methods and Costs at the Summitville Consolidated Mines, Inc., Summitville, Colo.: Bureau of Mines Inf. Circ. 6990, 1938, 23 pp.

Digitized by Google

### ROUTT COUNTY

*Hahns Peak district.*—The Hornet Gold Mining Co., working placer ground in Ways Gulch with a dragline-dry land dredge from May to September 1938, handled 21,000 cubic yards of gravel. Individuals produced a little gold by sluicing in the same area. No production was made from lode mines in the Hahns Peak district in 1938.

### SAGUACHE COUNTY

*Blake district.*—Development work in 1938 at the Copper Head claim resulted in the shipment of 4 tons of gold-copper ore to the International smelter at Tooele, Utah. The Cotton Creek Mining Co. shipped a test lot of copper-silver ore to the Garfield (Utah) smelter.

*Crestone district.*—Ore from the Eastern Star mine, one of the claims in the group in the mineral section of Baca Grant No. 4 under lease to the Luis Maria Baca Mining & Development Co., was treated by amalgamation and flotation in the company mill on Cottonwood Creek. A lessee at the Sunbeam claim recovered 15¾ pennyweight of amalgam 0.700 fine in gold from 3 tons of ore taken from an open-cut and treated in a 2-ton Gibson mill.

*Kerber Creek district (Bonanza).*—The Rawley mine, operated under lease throughout 1938 by Rawley Mines, a limited partnership, produced 6,764 tons of silver-copper-lead-gold ore, most of which was shipped to the copper smelter at Garfield, Utah; part of the remainder was concentrated in a custom mill at Bonanza, and part was shipped to the Leadville smelter. The W. C. H. Milling Co. treated 1,000 tons of ore from mines in the Kerber Creek district in a flotation mill built near Bonanza in 1938. Some ore was shipped direct to the Leadville smelter from the Klondyke, Rosalee, Sunnyside, and Warwick mines.

### SAN JUAN COUNTY

*Animas district.*—Operations of the Shenandoah-Dives Mining Co., a large, steady producer since 1928, were interrupted for 7 weeks in March and April 1938 by damage to the aerial tram connecting the mine and mill caused by a snowslide, but the expanded rate of ore production made possible through development work in the mine and an increase in the capacity of the mill enabled the company to handle more ore than in 1937 or any previous year, despite the interruption. Equipment added to the mill in 1938 included one eight-cell and one six-cell flotation machine and a thickener and conditioner. The daily capacity of the mill was 750 tons at the end of the year. The company ore treated totaled 211,293 tons and yielded 7,120 tons of concentrates containing 18,993 ounces of gold, 329,197 ounces of silver, 1,566,749 pounds of lead (wet assay), 1,556,980 pounds of copper (wet assay), and 1,025,647 pounds of zinc. During the first 10 months of 1938 the company made bulk lead concentrates and some zinc concentrates; during the remainder of the year it made four products—lead flotation concentrates, copper flotation concentrates, zinc flotation concentrates, and iron table concentrates. In addition to its own ore the company treated 7,072 tons of custom ore from other mines in San Juan County, comprising,

Digitized by Google

in approximate order of tonnage supplied, the Champion, Old Green Mountain, Ridgeway dump, Mystery, North Star-Sultan, Ezra R, Silver Ledge, Coming Wonder, Little Fannie, Bandora, Robert Bonner, and Snowslide. Some of the operators that shipped ore to the Shenandoah-Dives mill also shipped ore of smelting grade direct to the Leadville smelter. A few cars of ore were shipped to smelters from other mines in the district, including the Mexican group, Peerless, and St. Paul. A lessee at the Mable mine in the Copper Bell group treated 190 tons of gold-silver ore by amalgamation in a 10-ton mill at the mine. A 15-ton pilot mill erected at the Kankakee group was operated for a few weeks to test the ore. The American Smelting & Refining Co. continued development of the Silver Lake group through the 3,000-foot crosscut from the main haulage adit of the Mayflower group. Sluicing at the Depression placer claim 6 miles northwest of Silverton and at another placer in Red Canyon produced several ounces of placer gold.

*Eureka district.*—The Sunnyside Mining & Milling Co., which reopened the Sunnyside mine in 1937 and began production September 1, continued operations to June 30, 1938, when the mine was closed and remained idle to the end of the year; it was, however, the largest producer of lead and zinc in the State in 1938 and an important producer of gold, silver, and copper. The ore was transported from the mine over a 3½-mile aerial tram to the company 1,000-ton selective flotation mill at Eureka for treatment. The products of the mill were zinc concentrates (carrying also lead, copper, silver, and gold) shipped to the zinc smelter at Amarillo, Tex., and lead concentrates and iron concentrates (both carrying gold, silver, copper, and zinc) shipped to the Leadville smelter. In the latter part of the year the company did some work on a proposed 16,000-foot development and transportation adit to reach from the mine workings to the mill but suspended all activity at the property early in 1939. High-grade gold-silver-lead ore was shipped from the Brooklyn group to the Leadville smelter. Lessees at the Robert Bonner group shipped 38 tons of ore to the Shenandoah-Dives mill. Development work was continued at the Sandiago-Golden Fleece-Scotia group.

*Ice Lake Basin district.*—The Blanco Mining Co. drove 148 feet of drifts at the Bandora group from June 24 to November 5, 1938, and shipped 36 tons of ore to the Shenandoah-Dives mill and 137 tons to the Leadville smelter.

### SAN MIGUEL COUNTY

*Iron Springs district (Ophir).*—The Butterfly Consolidated Mines, Inc., operated its group of mines and 100-ton gravity- and flotation-concentration mill continuously in 1938. The mill treated 16,000 tons of ore which yielded 2,002 tons of combined table and flotation concentrates containing 1,066 ounces of gold, 139,783 ounces of silver, 339,764 pounds of lead (wet assay), 74,854 pounds of copper (wet assay), 40,853 pounds of zinc, and 1,075,812 pounds of iron. The concentrates were shipped to the Midvale (Utah) smelter. The company drove 1,000 feet of development drifts and tunnels during the year and discovered a new body of silver-lead ore in a heretofore undeveloped vein. Several cars of smelting ore were shipped from the Carbonero and Hattie mines. Lessees treated approximately

Digitized by Google

50 tons of old tailings from the Suffolk millsite in a small amalgamation-gravity concentration mill erected to test the material. A little ore was shipped from other properties in the Iron Springs district, and some gold was recovered by amalgamation at the Gold Bar lode group and by placer methods at the Waterfall placer.

*Lower San Miguel district* (*Sawpit, Vanadium*).—Placer miners sluicing along San Miguel River and its tributaries produced some gold in 1938.

*Mount Wilson district.*—Individuals working the Special Session, Polar, Lakeview, and Silver Pick groups during the summer of 1938 shipped small lots of high-grade gold ore to smelters.

*Upper San Miguel district.*—Veta Mines, Inc., maintained production from the Smuggler Union mine at a higher rate in 1938 than in 1937 and continued to be the largest producer in San Miguel County. Part of the ore produced in 1938 came from above the Pennsylvania Tunnel or fifteenth level, the former lowest workings, and part from the new 1,600-foot level. Additional productive ground was opened as the company carried exploration to greater depth, reaching the Telluride Conglomerate formation at the 1,700-foot level. The company made many surface improvements to effect economies in the handling and treatment of ore, including the construction of a new aerial tram rerouting ore transportation and the transfer of milling facilities to the large steel and concrete building adjoining the old plant. The yield from 68,777 tons of ore treated by amalgamation and flotation concentration and 109 tons shipped crude to smelters was 12,788 ounces of gold, 227,684 ounces of silver, and 1,552,003 pounds of lead (gross in concentrates and smelting ore). Alta Mines, Inc., continued developing the Alta-St. Louis group and mined and treated a daily average of approximately 100 tons of ore throughout the year, except during short interruptions necessary for repairing or altering equipment. A lessee treated tailings on the Gold Run dump by gravity concentration for 80 days in 1938 and shipped gold-silver-lead-copper concentrates to the Leadville smelter. Lessees at the Tomboy group cleaned out and retimbered some of the caved workings on the Montana claim. They shipped a car of smelting ore and 21 tons of concentrates produced with jigs and tables from 1,000 tons of ore cleaned up on the surface. The equipment was dismantled later. A lessee worked 2 months on the Juan millsite in Telluride, treating old tailings with a screen and table. Some ore was treated by amalgamation at the Laura, Savage, and other claims operated on a small scale. Individuals sluicing along San Miguel River recovered small quantities of placer gold. The American Smelting & Refining Co. did 623 feet of drifting at the Fairview group after May 1 under an option agreement that was relinquished December 12.

### SUMMIT COUNTY

*Breckenridge district.*—The output from lode mines in the Breckenridge district in 1938 comprised chiefly gold and gold-silver-lead ores shipped crude to the Leadville smelter from the Bemrose-Bostwick (also produces placer gold), Blue Flag, Fredonia, and Jumbo properties and zinc-lead-gold-silver ore shipped from the Royal Tiger property to the custom concentrator at Midvale, Utah. The Continental Dredging Co. operated its floating connected-bucket dredge on Blue

Digitized by Google

River, which has been the chief producer of gold in Summit County since 1932, from January 1 to April 13, 1938, when the company ceased operations. The dredge (equipped with 88 buckets, each of 7½ cubic feet capacity) was then dismantled, and the machinery was moved to Beaver Creek in Park County where it was used by the Timberline Dredging Co. in the construction of another dredge. The Bemrose-Bostwick and Louis D placers, each worked with a steam shovel and specially constructed sluice, were among the other principal producers of placer gold in the district. The Beaverhead, High Bar, John Jay, Pittsburg, and many other placers on Blue River, Farncomb Hill, and French Gulch were worked with sluices and hydraulic giants by individuals.

*Montezuma district.*—The Florado Mining Co., operating from March to July 1938, drove 300 feet of development crosscuts, drifts, and raises at the Florado-Sts. John group and erected a 100-ton flotation mill. During the period the company treated 2,100 tons (wet weight) of silver-lead ore; the concentrates were shipped to the Leadville smelter. Zinc-lead-silver ore from the Wauneita claim was shipped to the custom concentrator at Midvale, Utah. The ore produced at other mines in the Montezuma district in 1938 was shipped to the Leadville smelter. Producing mines included the Bullion group, Hall, New York, Ruby Silver, and Silver King claims.

*Ten Mile (Kokomo, Robinson) district.*—The Gold Crest Mining Co. shipped 80 tons of sorted gold-silver ore from the Gold Crest mine, operated 175 days in 1938, to the Leadville smelter. Lead-silver ore sold to the smelter from another property, a small lot of silver-gold ore shipped by lessees at the Washington group, and a small lot of placer gold recovered at the Lucky Penny placer comprised the remainder of the output from the Ten Mile district during the year.

*Wilkinson district.*—Walter McDaniel worked his Big Four claim (opened July 23, 1937, on Green Mountain) during part of 1938 and shipped 196 tons of silver-lead-gold-[zinc] ore to the Leadville smelter. A few truckloads of gold-silver-lead ore were shipped to smelters from the King Solomon and Fish Tunnel groups.

## TELLER COUNTY

### CRIPPLE CREEK DISTRICT

The Cripple Creek district produced, in terms of recovered metal, 145,215 fine ounces of gold in 1938 compared with 145,071 ounces in 1937. The bulk of the gold was recovered in the form of bullion at the Golden Cycle mill at Colorado Springs, El Paso County. As the mill also treats ores from other Colorado mining districts, its operations are reviewed under El Paso County. Cripple Creek ores shipped to the mill in 1938 totaled 480,105 tons and comprised all the district output except that from the Iron Clad group treated by cyanide leaching at the mine and part of the production from the Cameron group treated in a new flotation mill on the property. The ore shipped generally contains gold as the only commercial metal, but some silver ore has been shipped from two or three veins in the district; a comparatively small quantity of silver is recovered annually in bullion produced from the gold ores.

Digitized by Google

MINES REVIEW

The three largest producers of gold in the Cripple Creek district and in the State in 1938 were the United Gold Mines Co., an operating and holding company for property scattered throughout the district; the Cresson Consolidated Gold Mining & Milling Co., operating the Cresson, Dante, and Gold Sovereign mines; and the Golden Cycle-Ajax operations, working the Ajax-Granite group.

The annual report of the United Gold Mines Co. for the year ended December 31, 1938 (dated February 15, 1939), includes a report of the mine superintendent, which gives the following details on operations at individual mines:

*Bonanza.*—On the 22d level a low-grade body has been opened up on the X-10-U-8 vein. The grab samples run between 0.20-0.25 ounce. No stoping has been done on this to date. 270 feet of development work have been done on the 22d level.

On the 23d level the X-10-U-8 vein has been drifted on for 150 feet with no values encountered.

*Deadwood.*—The Gold Bullion Mines, Inc., lessees on the Deadwood, have produced a large tonnage of much better than average grade ore during the year and have also accomplished about 800 feet of development work on the first, second, and third levels. At the present time they are working three different ore shoots. One ore shoot on Trachyte ground has recently produced a carload of screenings which settled at 4.38 ounces. Prospects for this property during the coming year are very bright.

*Findlay-Shurtloff.*—The Golden Conqueror Mines, Inc., lessees on this property, has been very active during the past year, having accomplished 1,480 feet of drifting, 190 feet of raising, and 8 feet of winzing. They have also cleaned 80 feet of drifts on the 1,000 level of the Shurtloff and repaired 990 feet in the Manway side of the Shurtloff shaft. During the first 11 months of the year they have produced 10,423 tons of ore with a gross value of $107,488.67, and an average value of $10.31 per ton.

*Hull City.*—Operations on the Hull City were recently started by the United Gold Mines Co., and three sets of lessees operating on the split-check system have all discovered some ore, and we feel very hopeful that the mine will soon be on a paying basis.

*Isabella.*—This entire property has been leased to Hoy & Todd and associates and is the objective of a tunnel recently started on the 20th level of the Vindicator shaft. This tunnel will be 4,700 feet long; of this distance, approximately 1,300 feet has already been driven, but at the present time work on the tunnel has been suspended due to reorganization of the company. They expect to resume operations about January 10, 1939. A number of sets of sublessees are working on the surface and are producing some ore.

*Mountain Beauty.*—This entire property is leased to the Orpha May Leasing Co., and is being worked from the 13th level of the Orpha May shaft. They are driving a drift into Mountain Beauty ground and have discovered a small ore shoot and have shipped a few carloads of medium-grade ore.

*Patti Rosa-Hardwood-Little Joe.*—This entire property consists of about 15 acres and during the past year has been operated by the Tennessee Mines, Inc. This company has accomplished 1,193 feet of drifting and 450 feet of raising. It has mined 83,683 cubic feet of ore from the stopes and has shipped 91 railroad cars from the Hardwood, 6 cars from the Patti Rosa, and 9 cars from the Little Joe. This has all been medium-grade ore.

*Portland.*—The Portland Group has made a moderate but steady production through 1938, and the prospect for a continuation at the same rate in 1939 is good.

Portland No. 1, Portland No. 2, and the Last Dollar shafts have been operated by the company, with an average of 10 sets of lessees at No. 1, 6 sets of lessees at No. 2, and 10 sets of lessees at the Last Dollar.

No work has been done by the company underground except necessary repair work. All other mining has been done by lessees. A considerable amount of development was accomplished by lessees, some of it with assistance from the company. A fair amount of ore was developed by this work, and this has enabled the mine to maintain production.

Digitized by Google

The more notable discoveries include the ore shoot on the Bobtail vein, above 1,600 level, Portland No. 1; a new ore shoot on the Wisconsin vein, 1,300 Last Dollar, and the uncovering of some new ore bodies adjoining old stopes on the Wisconsin and 1,218 veins of the Last Dollar.

In addition to the company operated shafts, various other portions of the Portland Group have been operated by lessees on a royalty basis. Among these are the Independence, Colorado City, Portland No. 3, and several shallow shafts on Battle Mountain. These have contributed substantially to the total production.

The water in Portland No. 2 workings is receding very slowly, because of drainage from Ajax or Cresson pumping, and eventually another level (2,400) may be accessible.

*Rose Nicol-Trail-Last Effort.*—The Rose Nicol has produced a good grade of ore during the past year. Most of the company production has come from 900 and 1,000 through the Rose Nicol shaft, and from 1,700 of the Cresson. Production from 1,400 Cresson was stopped July 1.

A large low-grade deposit has been developed below 1,000 from the Berger winze, and at the present we are cutting out in the winze so that we will be able to start drifting on the Trail vein towards the shaft. Also a cross-cut is being driven from 1,700 of the Cresson to cut the Trail vein at greater depth.

On July 1 the mine was opened to lessees from 1,000 to surface, with the exception of a few blocks withheld by the company. The lessees have been heavy producers, with most of the ore coming from the 300 and 1,000 levels.

*Theresa-Anna J.-Tateman-Logan Tract-Gold Knob.*—Fourteen sets of split-check lessees are operating on the Theresa; of these lessees two sets are producing a good grade of ore, the other sets are all producing from medium- to low-grade ore. During the past year the Theresa shaft has been repaired and retimbered from surface to the 10th level.

Hansen & Co., working through the 8th level of the Theresa shaft, has drifted 500 feet on the contact between the granite and breccia on the Logan Tract. We consider this one of the most important developments in the Cripple Creek district.

The Tateman shaft is operated on a royalty lease by Lee Baker & Co., and just recently they have started to produce a small tonnage of better than average grade ore.

The Anna J. shaft is under lease to the Anna J. Leasing Co., and during the past year they have produced a fair tonnage of medium-grade ore.

*Vindicator.*—The Vindicator has 25 sets of lessees. Most of these lessees are producing medium- or low-grade ore, but two sets are producing a good grade of ore. The Vindicator accomplished more development work during 1938 than it has for the last several years. No work with the exception of the Cameron Tunnel drive is being done below 1,800.

*Wild Horse.*—The old Wild Horse shaft is leased to Judge Dickerson and associates and is being managed by F. G. Blackwood. The new or Gleason shaft has just recently been leased to Saddler and associates, and operations will be started about the first of the year.

*W. P. H. Group.*—The lower part of the W. P. H. has been under lease to The Doyle Diamond Drilling Co., and while no work was actually done on W. P. H. ground, development was carried on very close to the W. P. H. on Jerry Johnson ground, which could have easily been of great value to the W. P. H. This area has had very little development at depth. The operation was not a success, however, and has been discontinued.

The upper levels of the W. P. H. have been under lease to Jerry Johnson Gold, Inc. A small amount of work has been done by sublessee on this ground, working from the Jerry Johnson shaft, with a small production being made.

*Production of company ore by United Gold Mines Co. in 1938*

| Mine | Net tons | Gross value | Company ore cash receipts | Average gross value per ton | Number of cars shipped |
|---|---|---|---|---|---|

*Production of properties of United Gold Mines Co. before and after organization of the company (May 15, 1902) to Dec. 31, 1938*

| | Net tons | Gross value |
|---|---|---|
| Ore mined before consolidation | 26,310 | $456,806.19 |
| Production under operation of United Gold Mines Co | 1,716,591 | 18,656,295.99 |
| Total to Dec. 31, 1938 | 1,742,901 | 19,113,102.18 |

The annual report of the Cresson Consolidated Gold Mining & Milling Co. for the 12 months ended December 31, 1938 (dated February 1, 1939), says—

During the 12 months 63,533 dry tons of ore were shipped on company account, of a gross value of $466,821.89, averaging $7.35 per ton. The returns, less transportation and treatment of $220,775.30, were $246,046.59; giving the ore a net value of $3.87 per ton.

The company received as additional income the sum of $2,878.56 from interest and miscellaneous income. Net royalty of $239,547.29 on 68,890 tons lessee ore made a total of $488,472.44, with total expenses of $358,343.86, resulting in a net gain from operations of $130,128.58.

*Development*

| | *Feet* | *Feet* |
|---|---|---|
| Drifts and crosscuts: | | |
| Company | 6,069 | |
| Lessees | 1,459 | |
| | | 7,528 |
| Raises and winzes: | | |
| Company | 582 | |
| Lessees | 1,220 | |
| | | 1,802 |
| | | 9,330 |

The 18th level, which is 125 feet below the Roosevelt Drainage Tunnel, is at the present time producing the greater part of the company's tonnage. The ore from this level is low-grade, but the ore body is large and cheaply mined. This level should continue to produce a good tonnage throughout the year 1939.

A storage-battery locomotive has been installed and other improvements made in order to cut our haulage cost as much as possible.

Company work is being carried on from the 11th level down, and some ore is being produced on nearly every level. All workings have been maintained and kept open in order that they are accessible to any further operations.

Development work has been continued as in past years. During the past year, two new bodies of ore were opened on the 15th and 16th levels. Mining has not been started on either of these, so no estimate can be made on these ore bodies.

Digitized by Google

Twenty-six sets of split-check lessees are working through the Cresson shaft, most of whom are producing some ore.

The ore produced by both company and lessees has kept the hoisting plant running to full capacity throughout the year.

The Dante and Gold Sovereign shafts are operated by F. G. Blackwood, under a royalty lease. Both have made a good production during the year.

No attempt has been made to lower the water beyond the 18th level. Some unwatering plan should be made in the near future in order to prospect the ground below.

Various taxes, such as payroll and others, are showing an increase every year and now account for a considerable part of the total mining costs. However, during the past year, our total mining costs decreased 21 cents per ton over the previous year.

For the past 5 years, we have attempted to carry on a safety campaign in order to cut down accidents. This has resulted in a new rate set-up for the Cresson mine of $5.37 per $100.00 of payroll, against $6.81 for previous years. This will result in a substantial saving for the year 1939.

The average cost per ton shipped by company and the lessees during 1938 was $2.731 on a total of 132,423 tons.

[1] Represents 31.85 percent of gross value and 46.95 percent of net value.

The annual report of the Golden Cycle Corporation, dated February 15, 1939, for the calendar year ended December 31, 1938, contains the following paragraphs regarding the corporation's mining operations in the Cripple Creek district:

The Ajax shipped 53,040 tons with a gross value of $874,777.58, the freight and treatment amounting to $301,976.55. Since the Golden Cycle Corporation

Digitized by Google

purchased the Ajax in August 1935, it has produced 155,697 tons with a gross value of $2,605,450.01, the freight and treatment charges amounting to $886,263.10.

Mining expenses for the year have been very high, due largely to the amount of water encountered in the new development work, resulting in a loss for the year of $66,502.22; however, the last 4 months of the year showed a profit, and it is hoped the year of 1939 will show an operating profit. 9,261 feet of drifts, crosscuts, and raises were driven during the year.

Ore was opened on the New Market vein system on both the 2,400-foot and 2,600-foot levels, and the drifts are being pushed on this ore on both levels. On the 2,300-foot level a new ore body was encountered on the Bob Tail vein. This has very good possibilities both on the 2,400-foot and 2,600-foot levels. New development on the 2,600-foot level was badly hampered on account of water conditions, and all new work done on 2,600-foot was very costly in comparison to work above in the dry.

Every effort has been made to reduce operating expenses on the Ajax mine. A new washing and sorting plant is now under construction that will make a very good saving on the cost of ore sorting. This plant will be in operation about March 1, 1939.

Direct pumping costs on the Ajax property alone, not including the many extra costs due to working in heavy flows of water, were $83,399.35 for the year. This shows very definitely the necessity of a new drainage tunnel or central pumping plant that will drain the water to a greater depth than any property in the district is now working, if a supply of ore for the mill is to be maintained in future years. It is impossible for the Cresson, Ajax, or Vindicator mines to go deeper than they are now working, handle the water they will encounter, and operate at a profit.

Within the next few weeks estimates on the cost of a new drainage tunnel some 900 feet deeper than the present tunnel will be prepared for your consideration. Surveys for such a tunnel are now being carried on.[3]

The Anchoria Leland mine shipped 7,980 tons of ore with a gross value of $86,955.03. Net profit before depletion was $16,092.44 for the year of 1938. The Blue Bird lease results were disappointing, as no ore that could be worked at a profit was found. Work was discontinued on this property and the lease surrendered.

Companies and individuals leasing mines on the Stratton Estate together produced 25,898 tons of ore in 1938, which brought a net return of $159,856 after freight and treatment charges are deducted. The principal producing mines, in approximate order of metal output, were the Logan, Block 107, Orpha May, American Eagles, and Geneva; the other producers comprised the Abe Lincoln, Blocks 47, 98, 192, and 219, Callie, Favorite, Longfellow, Los Angeles, Pikes Peak, Specimen, Matoa, Sacramento, and War Eagle. The total development work done at all mines on the Stratton Estate in 1938 was 8,470 feet.

The Free Coinage group continued to be an important producer in 1938. Part of the property was worked by Golden Conqueror Mines, Inc., and Gold Bullion Mines, Inc., in combination with leases on the United Gold Mines property, and part was operated by other lessees. The Lark Mining Co. was a steady shipper from the Queen and Forest Queen groups, operated under lease. The New Gold Dollar Mining Co. property was operated for the first 9 months of 1938 by the Trio Gold Mining Co. under a lease, and for the remainder of the year by the New Gold Dollar Mining Co., owner. The Elkton, Doctor Jack Pot, Empire Lee, Acacia, Jerry Johnson, and Irving Howbert (Ethel Louise) groups were operated continuously. Gold Producers, Inc., worked the Victor mine on the Smith Moffat property under lease and the company-owned El Paso group. The Queen Bess Mining Co. shipped considerable ore from the Black Belle group. The Tenderfoot Mining Co. continued developing the Mollie Kath-

[3] Driving of the tunnel was authorized by the Golden Cycle Corporation in March 1939.

Digitized by Google

leen, Sangre de Cristo, and other groups on Tenderfoot Hill and shipped some ore. Cameron Mines, Inc., erected a 100-ton flotation mill at the Cameron shaft to treat low-grade sulfide ores from the Cameron and Pinnacle groups. The mill was run most of November and December, but not at capacity. The concentrates made were shipped to the Leadville smelter. The exploration and drainage tunnel begun by Cameron Mines, Inc., in 1937 to reach from the 2,000-foot level of the Vindicator shaft to the Isabella shaft had been driven approximately 1,000 feet by the end of 1938 and opened some ore on property of the United Gold Mines Co. Ore mined by the glory-hole system at the Iron Clad group was treated by cyanide leaching at the mine. During the year the Dooley Leasing Co. completed the purchase of the Rittenhouse group and shipped a substantial quantity of ore. Some of the other producing mines and dumps in the Cripple Creek district in 1938 were the Adney, Atlas (Midget-Bonanza King), Buckeye, Delmonico, Dolly Varden, Economic dump, Friday, Golden Swan group, Hamlet Dexter, Hiawatha, Index, Joe Dandy, Le Clair (Mary McKinney), Mary Nevin, Old Gold, Prince Albert, Rainbow, Ramona, Santa Rita Extension, School Section, Sheriff, and Strong.

Placer gold and high-grade specimen ore from the district, sold to assayers, refiners, and the Denver Mint, yielded 61 fine ounces of gold.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN THE EASTERN AND CENTRAL STATES

(MINE REPORT)

By J. P. Dunlop and H. M. Meyer

## SUMMARY OUTLINE

| | Page |
|---|---|
| Summary | 313 |
| Calculation of value of metal production | 313 |
| Mine production in the Eastern States | 317 |
| Alabama | 317 |
| Georgia | 317 |
| Maryland | 318 |
| New Jersey | 318 |
| New York | 318 |
| North Carolina | 318 |
| Pennsylvania | 319 |
| South Carolina | 319 |
| Tennessee | 320 |
| Virginia | 321 |
| Mine production in the Central States | 322 |
| Quantity and tenor of ores | 322 |
| Production of lead and zinc by regions | 322 |
| Review by States | 323 |
| Arkansas | 323 |
| Illinois | 323 |
| Kansas | 323 |
| Kentucky | 325 |
| Michigan | 325 |
| Missouri | 328 |
| Oklahoma | 331 |
| Wisconsin | 333 |

The most significant features of mining and milling in the Eastern States in 1938 were the large increase in production of gold in South Carolina, and the relatively small decrease in production of zinc compared with the large decrease in zinc reported in the Central and Western States. The dominating event in the Central States, aside from the great decline in output of lead and zinc, was the acquisition of all mines, leases, mills, power plant, and other equipment of the Commerce Mining & Royalty Co. in Oklahoma and Kansas by the Eagle-Picher Mining & Smelting Co. The output of silver, copper, and zinc from mines in the Eastern States decreased in 1938, but silver production in the Central States increased. No gold was reported produced by any mine in the Central States; the output of gold from mines in the Eastern States increased 9,247 ounces (owing mainly to an increase of 9,198 ounces in South Carolina), notwithstanding a decrease of 2,419 ounces in Alabama.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935-38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935-37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

*Number of lode and placer mines producing and yield of gold and silver in the Eastern States in 1938, by States*

| State | Number of mines | | Gold (fine ounces) | | Silver (fine ounces) | |
|---|---|---|---|---|---|---|
| | Lode | Placer | Lode [1] | Placer | Lode [1] | Placer |
| Alabama | 1 | 2 | 30 | 11 | 3 | |
| Georgia | 7 | 15 | 294 | 578 | 36 | 35 |
| Maryland | 2 | | 855 | | 24 | |
| New Jersey | 2 | | | | | |
| New York | 2 | | | | 37,200 | |
| North Carolina | 14 | 6 | 1,861 | 17 | 5,500 | |
| Pennsylvania | 1 | | 1,422 | | 9,360 | |
| South Carolina | 10 | 2 | 11,677 | 4 | 3,950 | 1 |
| Tennessee | 7 | | 236 | | 38,333 | |
| Virginia | 5 | 1 | 2,886 | 57 | 500 | 2 |
| Total, 1937 | 51 | 26 | [1] 19,261 | 667 | [1] 94,906 | 39 |
| | 39 | 40 | [1] 10,049 | 632 | [1] 106,843 | 30 |

[1] 1938: Dry and siliceous gold ores (88,671 tons) yielded 17,441 ounces of gold and 4,813 ounces of silver; copper ore (615,403 tons) yielded 375 ounces of gold and 42,470 ounces of silver; pyritiferous magnetite ore yielded 1,422 ounces of gold and 9,360 ounces of silver; zinc ore (1,530,295 tons) yielded no gold or silver; and zinc-lead ore (925,511 tons) yielded 23 ounces of gold and 38,263 ounces of silver.
1937: Dry and siliceous gold ores (60,542 tons) yielded 8,328 ounces of gold and 1,505 ounces of silver; copper ore (727,015 tons) yielded 373 ounces of gold and 53,491 ounces of silver; pyritiferous magnetite ore yielded 1,348 ounces of gold and 9,497 ounces of silver; zinc ore (1,679,334 tons) yielded no gold or silver; and zinc-lead ore (940,992 tons) yielded 42,350 ounces of silver.

*Gold.*—The production of gold in the Eastern States was 19,928 fine ounces in 1938, or 9,247 ounces more than in 1937. The output from siliceous ores increased from 8,328 ounces in 1937 to 17,441 ounces in 1938, that from placer mines from 632 to 667 ounces, and that from the refining of copper bullion from 1,721 to 1,797 ounces. Four gold-lode mines—two in South Carolina and one each in North Carolina and Virginia—produced more than 77 percent of the total gold recovered in the Eastern States in 1938. More lode mines but fewer placers were operated in 1938 than in 1937, and only two placers yielded more than 100 ounces of gold in 1938. The estimated output of gold in the Southern Appalachian States from 1799 to 1938, inclusive, is recorded as 2,532,776 fine ounces valued at $53,103,245.

In 1938, 88,671 tons of siliceous ore (from mines in Alabama, Georgia, Maryland, North Carolina, South Carolina, and Virginia) were treated, of which 87,615 tons went to gold and silver mills. Gold concentrates (542 tons) shipped to smelters yielded 2,497 ounces of gold, whereas bullion from gold milling plants yielded 13,894 ounces. Ore amalgamated (11,621 tons) yielded in bullion 1,633 ounces of gold and ore cyanided (75,994 tons) yielded 12,261 ounces. Only 1,056 tons of dry and siliceous ore were shipped crude to smelters; it yielded 1,050 ounces of gold.

Copper concentrates shipped to smelters yielded 1,632 ounces.

No mines in the Central States produced gold in 1938.

*Silver.*—Of the silver (94,945 fine ounces) produced in 1938 in the Eastern States, 39 ounces came from placer bullion, 3,709 ounces from bullion recovered at gold and silver mills, 82,048 ounces from concentrates smelted, and 9,149 ounces from ore shipped crude to smelters. Siliceous ores yielded 4,813 ounces of the silver; zinc-lead ores from New York, North Carolina, and Tennessee 38,263; copper ore 42,470; and copper concentrates recovered by flotation from pyritiferous magnetite ore 9,360 ounces.

Digitized by Google

The production of silver in the Central States in 1938 was 386,210 ounces. The output of Illinois (576 ounces) came from galena concentrates recovered in milling fluorspar, that of Missouri (292,000 ounces) was derived from the refining of lead bullion, and that of Michigan (93,634 ounces) came from copper ore.

*Copper.*—The mine production of recoverable copper in the Eastern States was 21,079,160 pounds valued at $2,065,758 in 1938 compared with 24,444,000 pounds valued at $2,957,725 in 1937. The output from Tennessee was considerably less than in 1937 and that from Pennsylvania increased, but the Bureau of Mines is not at liberty to show the copper production of each State. Gold ore and concentrates shipped to smelters from Georgia, North Carolina, South Carolina, and Virginia yielded small quantities of copper, but most of the total was derived from copper ore mined in North Carolina and Tennessee and from copper concentrates recovered from Pennsylvania pyritiferous magnetite ore mined for its iron content. The output of copper from gold ore in 1938 was 16,570 pounds. Copper ore yielded about 0.0006 ounce of gold and 0.07 ounce of silver to the ton of crude ore. Copper concentrates from the magnetite ore contained about 22.5 percent copper and 0.11 ounce of gold and 1 ounce of silver to the ton.

The copper output of the Central States in 1938 came entirely from Michigan copper mines. The output of refined copper from Michigan decreased from 94,928,000 pounds in 1937 to 93,486,000 pounds in 1938, but the average recovery per ton of rock increased from 22.6 to 24.9 pounds.

*Lead.*—The recoverable lead produced from mines in the Eastern States in 1938 came from zinc-lead ores from the Austinville mine in Virginia, the Balmat mine in New York, the Embree mine in Tennessee, and the Silver Hill mine in North Carolina. Shipments of galena or lead carbonate concentrates totaled 12,018 tons and yielded 7,900 tons of lead, or 2,361 tons more than in 1937.

Lead recovered from shipments of lead ore and concentrates in the Central States decreased from 204,855 tons in 1937 to 158,873 tons in 1938 owing mainly to the decrease in shipments from southeastern Missouri, the largest lead-producing region in the United States, from 153,205 to 118,870 tons. Mines in the Tri-State or Joplin region shipped 51,751 tons of lead concentrates in 1938 compared with 65,765 tons in 1937.

*Zinc.*—The recoverable zinc in ore and concentrates shipped from mines in the Eastern States totaled 172,501 tons valued at $19,211,235 in 1938 compared with 189,353 tons valued at $24,894,159 in 1937. Mines in New Jersey yielded 85,839 tons as metal or in oxide.

[N. B.—The value of the zinc in New Jersey is the estimated smelting value of the recoverable zinc content of the ore after freight, haulage, smelting, and manufacturing charges are added.]

The output of recoverable zinc from New York mines decreased from 32,690 tons in 1937 to 29,896 tons in 1938; it was derived from zinc ore and zinc-lead ore. Zinc sulfide ores yielded all the zinc produced in Tennessee except that from zinc-lead carbonate ore of the Embree mine and copper ore of the Tennessee Copper Co. The recovered zinc content of sphalerite concentrates shipped from mines in Virginia may not be disclosed, but the total from concentrates shipped from

Digitized by Google

Tennessee and Virginia in 1938 was 56,766 tons; there was an increase in the output of each State.

Zinc concentrates shipped from mines in the Central States had a recoverable zinc content of 198,721 tons in 1938 compared with 244,045 tons in 1937. Mines in the Tri-State region shipped ore and concentrates yielding 196,174 tons of zinc in 1938, Oklahoma contributing 58 percent and Kansas 37 percent. Stocks of sphalerite were negligible at the end of 1938. The recoverable zinc in shipments from Missouri mines decreased from 20,600 to 10,226 tons; in 1938 all the output came from southwestern Missouri, but in 1936 and 1937 small shipments of sphalerite were made from southeastern Missouri.

## MINE PRODUCTION IN THE EASTERN STATES

*Alabama.*—The quantity of gold produced in Alabama from 1830 to 1938, inclusive, has totaled 49,450 fine ounces. The output in 1938 was only 41 ounces compared with 2,460 ounces in 1937. The Hog Mountain mine, which had the largest output of gold in the Appalachian States in 1937, was idle in 1938. Production in 1938 was from two placer mines, in Tallapoosa and Talladega Counties, and from the Gold Log lode mine and mill in Talladega County, operated for a short period by the Guy S. Amos Mining Co.

*Georgia.*—From 1830 to 1938, inclusive, Georgia is reported as having produced 868,537 fine ounces of gold. In 1938, 15 placers and 7 lode mines yielded 872 ounces of gold and 71 ounces of silver. Of the 578 ounces of placer gold produced, 111 ounces came from mines near Dahlonega and Auraria in Lumpkin County, 425 ounces from mines near Sautee, Helen, and Nacoochee in White County, and the remainder from mines in Dawson, Hall, Cherokee, and Paulding Counties. The largest producers of placer gold were the Ferey Gold Mining Co. and the Dixie Gravel Co., both in White County. Gold recovered from 841 tons of siliceous ore amounted to 294 ounces and came mainly from the Hamilton mine in McDuffie County, operated by W. T. Fluker. The 10-stamp amalgamation-concentration mill was in operation for about 6 months on ore taken from two shafts; development work totaled about 690 feet. Various properties at Dahlonega controlled by Dr. Craig R. Arnold were leased or under option, and some should be productive in 1939. The Ferey Gold Mining Co. at Nacoochee, White County, the largest producer of gold in Georgia in 1938, operated its mine steadily all year by means of a dragline, trommel screen, and sluice boxes. The Simmons prospect near Buford, Gwinnett County, was worked by A. W. Amphlett Gold Mines. The Dixie Gravel Co. had a good output from the Dukes Creek placer mine, which was worked 120 days using a hydraulic elevator. The Shelley mine in Gwinnett County was operated about 10 months by Gavin D. McKay and J. B. McKay, and a 20-ton amalgamation-concentration plant was built. Some ore was milled, and a car of crude ore was shipped to Carteret, N. J. The shaft at the Shelley mine is 80 feet deep, and there are 150 feet of drifts. The Big Joe mine in Hall County was operated by Elmore Bish, and the bullion that was shipped was recovered by amalgamation at a small pilot mill; about 370 feet of drifting were done in 1938. A. D. Greenfield reopened the old Hobbs mine in Paulding County and made a small output. Gold bul-

Digitized by Google

lion was shipped to the mint by T. F. Christian, J. S. Speer, and J. R. McDonald from various small operations in Lumpkin and Dawson Counties. R. H. Stumann, of Canton, shipped bullion purchased at small mines or prospects in Cherokee County. The Big Bunker Hill Mining Co. did not ship any bullion in 1938 but made extensive tests on its property and installed equipment to handle the saprolite by means of draglines and a log washing plant.

*Maryland.*—The total gold production of Maryland to the end of 1938 is estimated at 6,031 fine ounces. Until 1936 no gold had been produced in Maryland for many years, but in 1935 the Maryland Mining Co. did some development work in Montgomery County and in 1936 was the third largest producer of gold from gold ore in the Eastern States; in 1937 and 1938 it ranked fifth. The mine was worked nearly all of 1938; it is equipped with a 200-foot three-compartment shaft, and ore is mined at the 150- and 200-foot levels. The bullion sent to the mint was 950 fine and contained very little silver. The property controlled covers about 250 acres and is said to show numerous veins of good ore. Prospecting was done by Kirk & McNamara at the old Harrison mine and other prospects about 2½ miles from the Maryland mine. Two shafts were being sunk in November 1938, and some open-cuts were made. In one of these open-cuts a stringer of rich ore was found and panned. It yielded more than 40 ounces of gold. The bullion, which was sent to the Philadelphia Mint, had a fineness of 983. It is unusual for gold bullion to run even 950 fine, although some of the Georgia mines yield bullion of about that fineness.

*New Jersey* (see also second table of this chapter, footnote 1).—The production of zinc ore in New Jersey in 1938 was 528,595 tons containing 85,839 tons of recoverable zinc as metal or in oxide. The producing properties were the Sterling and Mine Hill mines; these mines were operated about 250 days in 1938 and have a much larger potential output.

*New York.*—The quantity of zinc ore mined and treated in New York decreased from 112,478 tons in 1937 to 105,000 tons in 1938 and that of zinc-lead ore from 352,392 to 280,600 tons. The total concentrates shipped yielded 29,896 tons of zinc and more than 2,000 tons of lead; the lead concentrates from the Balmat mine contain considerable silver also. The Balmat mine near Sylvan Lake produces zinc-lead ore, is equipped with a 1,250-ton all-flotation concentration plant, and has an enclosed shaft 1,300 feet deep. The Edwards mine has a vertical shaft 1,500 feet deep and an inclined shaft from the 1,500- to the 2,100-foot level. The all-flotation plant has a capacity of 550 tons. It is reported that the Universal Exploration Co. was doing some diamond drilling in St. Lawrence County in 1938.

*North Carolina.*—The gold output of North Carolina from 1799 to 1938, inclusive, is recorded as 1,154,677 fine ounces. The yield in 1938 was 1,878 ounces—1,861 ounces from 14 lode mines and 17 ounces from 6 placers. The output of silver was 5,500 ounces, of which 387 ounces came from dry gold ores, 206 ounces from zinc-lead ore, and the remainder from copper ore. The Fontana copper mine was the largest producer of silver and the third largest producer of gold in North Carolina in 1938, although the assay content of gold and silver is low. The largest producer of gold in North Carolina was the Capps

Digitized by Google

mine in Mecklenburg County. The meager output of placer gold came from small mines or prospects in Cabarrus, Guilford, Halifax, Stanly, and Union Counties. The North Carolina Exploration Co. shipped high-grade crude sulfide copper ore from the Fontana mine in Swain County to the Tennessee Copper Co. smelter at Copperhill, Tenn. About 77 percent of the gold output of North Carolina came from the Capps mine; the Capps mill, a 125-ton cyanide plant, is near Charlotte in Mecklenburg County. Custom ore from a few mines in North Carolina and from the Terry, Ross-Carroll, Spartan, and Dixon mines in South Carolina was milled also at the Capps plant; this mill had the second largest gold output in the Appalachian States in 1938. The Rudisil mine and 50-ton flotation plant at Charlotte were closed in March 1938 after 35 months of operation, during which time the reported output was $130,000. The Silver Hill mine in Davidson County, which has been idle many years, was reopened by T. A. M. Stevenson in August 1938. The ore mined is zinc-lead containing copper, gold, and silver. There are several shafts at the mine, one of which is an inclined shaft of 725 feet. One old shaft was cleaned out, and a new prospect shaft was sunk. The property is equipped with a 10-stamp mill and Deister slime tables. Only a small quantity of ore was treated; some lead concentrates were shipped to Carteret, N. J., but the zinc concentrates were held for further treatment. Several cars of crude ore from the Dixie Queen mine in Cabarrus County were shipped by J. A. Terry to Carteret, N. J.; the ore contained gold, silver, and copper. The Tribro mine in Halifax County was worked 60 days by Passavant Bros., and a small amalgamation plant was constructed; the ore was mined from an open-cut and yielded good recoveries of gold. Several hundred tons of ore were mined by W. L. Cotton from the Mumford, Stewart, and Carter mines near Albemarle in Stanly County. Other small producing lode mines were the Porter in Union County, the Halifax in Franklin County, and the Spoon in Randolph County.

*Pennsylvania.*—The Cornwall mine and mill in Lebanon County were operated steadily throughout 1938; the mine has an open-cut and three inclined shafts 1,300 feet deep. The ore is pyritiferous magnetite, and the tailings from the iron concentrates go to the 2,000-ton flotation plant; the copper concentrates, which contain about 22.5 percent copper and 0.11 ounce of gold and 1 ounce of silver to the ton, were shipped to the Nichols Copper Co. The Reynolds Metal Co. had an option to purchase the old Friedensville zinc properties in Lehigh County but allowed the option to lapse in 1938.

*South Carolina.*—From 1829 to 1938, inclusive, mines in South Carolina produced 268,413 fine ounces of gold. In 1938 the output from ten lode mines and two placers was 11,681 ounces, of which only 4 ounces came from placers. Gold milling plants recovered 10,552 ounces of gold and 3,252 ounces of silver, and crude ore and concentrates shipped to smelters yielded 1,125 ounces of gold and 698 ounces of silver. The old Haile mine in Lancaster County, with a reputed total production of more than $3,000,000 in gold, was worked throughout 1938. Its production and that of the Terry mine largely accounted for the notable increase in the gold output from South Carolina and from the Southern Appalachian States. The small output of placer gold came from the Brewer mine in Chesterfield County

Digitized by Google

and the Smith mine in York County. The Dorothy mine in York County was operated by the Thirty-Five Mining Co. until April 1938, and some crude ore was shipped to Carteret, N. J.; after April the mine was operated by W. H. Small, and 3 cars of crude ore were shipped to the Tennessee Copper Co. at Copperhill, Tenn. Among the mines in South Carolina that shipped ore to the Capps mill at Charlotte, N. C., were the Dixon and Ross-Carroll in York County and the Terry and Spartan in Cherokee County. The Ross-Carroll mine was operated 9 months by W. E. Tummon by means of open pits and trenches. Other production included that from the old Hegeler mine in Lancaster County, on which 200 feet of drifts were run; a few ounces of gold recovered in sampling the McGill and the Eustis mines in Cherokee County, both worked by H. M. Armstrong; and that from the Quinn prospect in York County, operated by R. B. Summerford. Crude ore from the McGill, Eustis, and Quinn was shipped to Carteret, N. J. The Terry mine near Smyrna was worked by Southern Gold, Ltd., for 11 months; two vertical shafts, 135 and 175 feet deep, were used to mine the ore, which was shipped partly to the Capps mill and partly to Carteret, N. J. The crude ore contains a little copper and silver, and the quantity of gold recovered was large considering the fact that the shipments of ore totaled less than 2,800 tons.

Haile Gold Mines, Inc., operated its mines and countercurrent decantation cyanide plant throughout 1938 and late in December completed a new mill unit that increased the daily capacity of the plant to about 400 tons. All the ore, which is a mixture of quartz and pyrite, is mined by open-cut methods. A new ore body was stripped by draglines, and ore was mined from two pits. The mines and mill comprise one of the most efficiently operated units in the Southern States, and although the ore is of comparatively low grade the ample reserves and low costs of mining, combined with efficient milling, have made the operations profitable. Geophysical exploration in 1938 indicated about 20 anomalies, and 28 churn- and 25 diamond-drill holes were finished in 1938. Twelve of these drill holes are on Red Hill. Drilling is being continued on other areas. The history of the Haile mine and its development and operation by the present owners have been described by Brodt and Newton.[1]

*Tennessee.*—Mines in Tennessee produced 19,475 fine ounces of gold from 1831 to 1938, inclusive; almost the entire output since 1906 has come from copper ore, and copper bullion was the sole source of the 236 ounces produced in 1938. The quantity of silver recovered in 1938 was 37,476 ounces from copper ore and 857 ounces from zinc-lead ore. The Embree Iron Co., the only producer of lead in Tennessee, shipped lead carbonate concentrates. The production of copper from Tennessee mines decreased about 1,600 tons from 1937 to 1938, but that of zinc increased about 475 tons.

The total output of copper from mines in Tennessee, North Carolina, South Carolina, Virginia, and Pennsylvania was 10,540 tons in 1938 compared with 12,219 tons in 1937; production increased in Pennsylvania, South Carolina, and Virginia. The total lead recovered from mines in New York, Tennessee, and Virginia was 7,896 tons in 1938 compared with 5,539 tons in 1937. The total zinc recovered from mines in Tennessee and Virginia was 56,766 tons in 1938 compared

Digitized by Google

with 55,255 tons in 1937; Virginia mines showed the larger increase. The Bureau of Mines is not at liberty to publish figures for the foregoing States separately.

The Tennessee Copper Co. ran its 1,200-ton (daily) flotation plant and its smelter, but not at capacity, on ore from the Burra Burra, Eureka, and Isabella mines in Tennessee and on sulfide ore from the Fontana mine in Swain County, N. C.; a few carloads of ore were received from other States. Some 48.2-percent zinc concentrates were produced at the mill and shipped to Donora, Pa., and the copper bullion was sent to the Nichols Copper Co. The Mascot mine and 2,600-ton concentrating plant of the American Zinc Co. of Tennessee were operated steadily in 1938; the mine is opened by a 520-foot shaft and an inclined shaft from the 520-foot level to the maximum depth of 850 feet. The output was larger in 1938 than in 1937. The company also worked the Grasselli mine, where operations were conducted at the 350-foot level. The crude ore from both mines was treated at the Mascot mill, which had been equipped with a differential-tension density cone that considerably increased the capacity of the plant. The Universal Exploration Co. worked steadily in 1938 at both the mine and 800-ton all-flotation mill, but the plant for treating zinc carbonate ore was idle throughout 1938. The average grade of the sphalerite shipped in 1938 was 64.765 percent zinc, which is considerably higher than that from any other mine in the United States. The Embree Iron Co. in Washington County shipped some zinc carbonate concentrates and increased its shipments of lead carbonate about 250 tons. A log washing plant was used to treat the crude ore. About 1 carload of zinc carbonate ore was shipped in 1938 by C. A. Wilson, of Jefferson City. Both the Mascot and Universal properties obtained much lower electric-power rates in October 1938, thereby reducing operating costs considerably.

*Virginia.*—Mines in Virginia produced 166,193 fine ounces of gold from 1828 to 1938, inclusive, but only 7,076 ounces have been produced during the last 28 years. In 1938 the output of the State was 2,943 ounces of gold and 502 ounces of silver from five lode mines and one placer. Shipments of both lead and zinc concentrates increased, but the Bureau of Mines is not at liberty to publish figures for lead and zinc output as the Austinville mine of the Bertha Mineral Co. is the only producer of zinc-lead ore in Virginia. The mine and 2,000-ton concentration-flotation mill were operated steadily throughout 1938.

Most of the gold produced in Virginia in 1938 came from the Vaucluse mine near Wilderness, Orange County. This mine has a vertical shaft 325 feet deep, and 435 feet of drifts were run in 1938. The sulfide ore is treated at a 75-ton all-flotation plant, and the concentrates are shipped to Carteret, N. J. The mine was worked from January to November, and then some exploration work was done on placer ground. The Red Bank mine near Virgilina, Halifax County, was operated 216 days by Joseph Hamme; the property is equipped with a small amalgamation plant. The Bull Neck lode-gold mine near McLean, Fairfax County, was idle in 1938. The Booker mine near Dillwyn in Buckingham County, which is equipped with a small amalgamation-concentration plant, was operated most of the year; bullion was shipped to the Philadelphia Mint and concentrates to

Digitized by Google

Carteret, N. J. Some crude copper ore containing 15 percent copper and a little silver was shipped by the Nassog Co. from a prospect in Floyd County to Carteret, N. J. The placer-gold output of Virginia in 1938 came mainly from the Bertha and Edith mines in Goochland County, which were operated 5 months by means of a gasoline dragline by H. H. Walton, of Pendletons.

## MINE PRODUCTION IN THE CENTRAL STATES

*Quantity and tenor of ores.*—The only fair basis for comparing the relative magnitude of mining in different States is the quantity of crude ore or "dirt." The metal content of the ores of the several mining regions and States exhibits marked differences; therefore, comparison of tenor of the ores is interesting and significant. Virtually all the ore from the Central States is of such low tenor as to require concentration. In Kentucky and southern Illinois most of the lead and zinc concentrates are recovered as byproducts in the concentration of the fluorspar that they accompany, and the metal content of the crude ore raised cannot be calculated. In Arkansas very little ore has been mined for several years, and the average tenor calculated from the output of ore during these years would not offer accurate comparison with that during a period of active mining.

*Quantity and tenor of copper, lead, and zinc ores, old tailings, etc., produced in the Central States, 1936–38, by States*

| State [1] | 1936 | | 1937 | | 1938 | |

[1] No figures available for small quantity of ore treated in Arkansas, Illinois, or Kentucky.
[2] The percentages represent the metal content of the ore insofar as it is recovered in the concentrates. In Michigan the metal so recovered is copper; in other Central States the metals are lead and zinc combined, the relative proportions of which are shown in the second table of this chapter and in the tables of tenor of ore given in the sections devoted to the respective States.

*Production of lead and zinc by regions.*—The report of this series for 1930 (chapter of Mineral Resources of the United States, 1930, pt. I) gives the areas included in the seven lead- and zinc-producing regions of the Central States. Mineral Resources, 1914, contains brief reviews of the history of lead and zinc mining in the Central States, the yearly production of each State from 1907 to 1914, inclusive, and historical notes and estimates of the total production of lead and zinc in each State before 1907. Subsequent records year by year are found in Mineral Resources and Minerals Yearbook.

Of a total of 360,504 tons of blende concentrates produced in 1938 in the Tri-State region, 59,987 tons, or 54,283 tons less than in 1937, were derived from old tailings.

[1] Includes galena and a small quantity of lead carbonate concentrates.
[2] Includes sphalerite and a small quantity of zinc carbonate and zinc silicate concentrates.
[3] Includes Iowa, northern Illinois, and Wisconsin.
[4] The zinc concentrates shipped in 1938 were a flotation product or raw concentrates roasted at Cuba City, Wis. No raw concentrates were shipped in 1938; about 13,000 tons were produced.

## REVIEW BY STATES

*Arkansas.*—A total of 437 tons of zinc carbonate and mixed zinc carbonate and sulfide was shipped from about seven mines in Arkansas in 1938 compared with 777 tons shipped from Arkansas mines in 1937; the recoverable zinc in the concentrates in 1938 was 152 tons. None of the mines gave any data for 1937 or 1938 on their operations or shipments, but the smelters that purchased the concentrates gave the information. Shipments of zinc concentrates were made from the McIntosh mines and Silver Hollow, Monte Cristo, and Red Cloud mines in the Rush district; other shipments were made of small lots purchased from scrappers in Newton County. The only shipments of lead concentrates from Arkansas in 1938 were about 10 tons from the Ponca district, purchased by the Eagle-Picher Mining & Smelting Co.; the recoverable lead content was 7 tons.

*Illinois.*—No lead or zinc mines in Illinois were operated in 1938. Shipments of galena from fluorspar mines in southern Illinois in 1938 totaled 294 tons with an average lead content of 60.9 percent; 175 tons of lead and 576 fine ounces of silver were recovered from these shipments compared with 186 tons of lead and 887 ounces of silver in 1937. The Aluminum Ore Co. and the Hillside Fluor Spar Mines were the largest shippers. The Mahoning Mining Co. operated churn drills near Cave in Rock, Hardin County, and developed a body of fluorspar-zinc-lead ore which contains more zinc than is normally found with fluorspar. Two shafts were sunk, and flotation tests showed that the crude ore was amenable to treatment to recover lead concentrates, zinc concentrates, and fluorspar of good grade.[2] A mill under construction in 1938 is expected to be operated in 1939.

*Kansas.*—Shipments of galena concentrates from mines in Kansas totaled 19,909 tons with a recoverable lead content of 15,239 tons compared with 20,559 tons with a recoverable content of 16,008 tons

[2] Clemmer, J. B., Duncan, W. E., DeVaney, F. D., and Guggenheim, M., Flotation of Southern Illinois Lead-zinc-fluorspar Ores: Bureau of Mines Rept. of Investigations 3437, 1939, 31 pp.

Digitized by Google

in 1937. Shipments of sphalerite concentrates amounted to 133,546 tons with a recoverable zinc content of 73,024 tons in 1938 compared with 151,646 tons with a recoverable content of 80,300 tons in 1937. About 575,700 tons of Kansas crude ore were concentrated at mills in Oklahoma and yielded 45,204 tons of sphalerite concentrates and 6,217 tons of galena concentrates. In all, about 31 lead-zinc mines and 22 mills were operated in Kansas in 1938.

No output for 1938 was reported from the Lawton or Crestline camps, and little prospecting was done. Production in the Kansas part of the Waco area was mainly from tailings and from ore from the Acme mine treated by the B. H. & G. Mining Co. The old Acme mine was reopened early in 1938 and had a large output. The total output of the Waco area in 1938 was 103 tons of galena and 8,337 tons of sphalerite, of which properties in Kansas yielded 36 tons of galena and 5,772 tons of sphalerite. Some development work was done by the St. Louis Smelting & Refining Co. on its property at Waco, but the mines and 800-ton mill were idle. Operations at the Galena camp were confined to scrapping. Mines and mills near Baxter Springs shipped 4,184 tons of galena and 20,323 tons of sphalerite. The St. Louis Smelting & Refining Co. (mines and Ballard mill) was much the largest producer of both lead and zinc. Only a small quantity of old tailings was milled by the O. W. Bilharz Mining Co. Ore was mined and milled or shipped to custom mills from the Hocker, Robob, Wade, Iron Mountain, and Sunflower mines. Mines in the Blue Mound-Treece area shipped 15,659 tons of galena and 93,248 tons of sphalerite. Mines in Kansas that shipped ore to the Central mill at Cardin, Okla., included the Mid-Continent, Wright, Bendelari, Big John, Black Eagle, Silver Fox, and Northern. The Muncie mill of the Federal Mining & Smelting Co. resumed production in 1938. The larger producers in this area, other than those shipping to the Central mill, were: The Vinegar Hill Zinc Co. (Barr mine), Evans Wallower Zinc. Co. (No. 14), J. P. Dines Mining Co. (Blue Mound and Southern), American Zinc, Lead & Smelting Co. (Robinson), Commerce Mining & Royalty Co. (Wilber, Webber, and Chubb), the Cherokee mine, and the New Blue Mound mine. The four tailing mills in this area shipped 40 tons of galena and 13,782 tons of sphalerite; they were the Captain Milling Co., C. Y. Semple, Lewis Milling Co., and Youngman & Youse.

*Mine shipments of lead and zinc in Kansas, 1934–38*

| Year | Lead concentrates [1] | | Zinc concentrates | | Metal content [2] | | | |
|---|---|---|---|---|---|---|---|---|
| | | | | | Lead | | Zinc | |

| Sphalerite concentrates | 42.64 | 42.80 | 30.60 | 33.22 |

*Kentucky.*—Seven mines in Kentucky shipped 218 tons of zinc carbonate, 571 tons of sphalerite, and 196 tons of lead carbonate in 1938. The zinc carbonate sold was shipped largely by Avery H. Reed of Marion and by C. F. Lester of Princeton, and the sphalerite was from the Eagle Fluor Spar Co. property. The bulk of the lead concentrates were shipped by Roberts & Frazer (Kentucky Fluor Spar Co.), the Klondike Fluorspar Corporation, and the Lafayette Fluorspar Co. The lead carbonate averaged about 52.6 percent lead and the sphalerite about 48 percent zinc. The recovered content of ore shipped was 101 tons of lead and 322 tons of zinc.

*Michigan.*—Copper production in many districts of the United States was considerably lower in 1938 than in 1937, but output in Michigan was relatively stationary during the 2 years. The Isle Royale Copper Co. resumed active operations in 1938; otherwise the producers were the same as in 1937—that is, Calumet and Hecla Consolidated Copper Co., Copper Range Co., and Quincy Mining Co. The decline in output at Calumet and Hecla in 1938 was counteracted by increased activity at the Copper Range and Quincy properties and by the production at Isle Royale. With resumption of treatment of tailings in 1935, the grade of ore treated in Michigan fell steadily until 1938, when the ratio of tailings to new ore declined; consequently the average grade of ore treated rose from 1.13 percent in 1937 to 1.24 percent in 1938. The 3,757,705 tons of rock and sands treated in 1938 yielded 93,486,000 pounds of copper, compared with 4,197,881 tons yielding 94,928,000 pounds in 1937.

The Peninsula Copper Co., organized by bondholders of the Seneca Copper Corporation, acquired the assets of the bankrupt Seneca company in May and optioned the property to Calumet and Hecla. This mine includes a large area adjacent to the openings in the Kearsarge lode at North Ahmeek, and, according to the Calumet and Hecla company, openings at Ahmeek indicate that copper mineralization on the Kearsarge lode extends to some degree at least into Peninsula territory. Results of the exploration work are somewhat encouraging.

The Isle Royale Copper Co. resumed shipment of rock to its mill in July. Mining is confined to Nos. 4 and 5 shafts where the bulk of

Digitized by Google

the ore reserve is located. A description of operations at the Isle Royale mine was prepared by Eaton.[3]

The Quincy Mining Co., which reopened its mine in 1937, increased production in 1938. It was reported that the company was obtaining the highest yield of copper per ton of rock treated in many years (more than 34 pounds to the ton). Mining was proceeding on the 85th, 86th, and 87th levels of No. 6 shaft, which is opened to the 91st level.

[1] According to Bureau of the Mint.

The following data are abstracted from reports of the companies to their stockholders.

Production of copper by the Calumet and Hecla Consolidated Copper Co. in 1938 totaled 48,264,000 pounds at an average cost sold (excluding depreciation and depletion) of 7.37 cents a pound. The Lake Linden and Tamarack reclamation plants curtailed production throughout the year by treating sand below the average grade of reserves and operating at 60 percent of capacity for 5 months of the year. Together they recovered 16,619,000 pounds of copper at an average cost sold (excluding depreciation and depletion) of 6.86 cents a pound. In 1937 the mines produced 53,876,000 pounds at an average cost of 7.59 cents a pound and the reclamation plants 20,398,000 pounds at 6.63 cents. Benefits from the small decrease in costs

[3] Eaton, Lucien, Reopening and Rehabilitating the Isle Royale Copper Mine: Min. Cong. Jour., vol 24, No. 10, October 1938, pp. 39–43.

Digitized by Google

were more than wiped out by the lowering of the average price received from 14.11 cents a pound in 1937 to 10.03 cents in 1938. Exhaustion of the Conglomerate lode draws nearer with shafts Nos. 7 and 6 exhausted on September 30 and October 10, respectively, and exhaustion of No. 12 shaft expected during the summer of 1939.

*Operations at the Calumet and Hecla reclamation plants at Lake Linden and Hubbell in 1938 and for the entire period of their operation*

| | 1938 | Since starting |
|---|---|---|
| Quantity treated ---------- short tons | 1,934,000 | 31,098,000 |
| Assay headings ---------- percent | 0.517 | 0.666 |
| Assay tailings ---------- do | .085 | .128 |
| Refined copper produced ---------- pounds | 16,619,000 | 333,943,000 |
| Refined copper produced per ton treated ---------- do | 8.59 | 10.74 |

Of the 1938 production 5,288,000 pounds were from table treatment following grinding, 8,921,000 pounds from leaching, and 2,410,000 pounds from flotation. At the Calumet mill at Lake Linden 461,551 tons of Conglomerate rock were stamped. At the Ahmeek mill 667,412 tons of Kearsarge amygdaloid rock from the Ahmeek mine, 5,271 tons from No. 4 Kearsarge, and 8,876 tons from the Peninsula Copper Co. area were stamped. The smelter received 52,321 tons of concentrates, smelted 38,529 tons, and produced 46,418,962 pounds of refined copper. Copper oxide totaling 1,176 tons was shipped to customers. Results of explorations in the Mass-Michigan area in Ontonagon County were generally unfavorable.

The mine production of copper by the Copper Range Co. was 18,010,937 pounds, and copper produced at the tailings recovery plant amounted to 55,954 pounds, making a total of 18,066,891 pounds of copper. Of the copper produced, 1,618,986 pounds were from the Globe mine and the remainder from the Champion mine. Ore reserves at the Champion mine were reported to be about the same at the end as at the beginning of the year, but minable areas were more spotty and scattered. These conditions made mining more difficult and costs higher. The tailings recovery plant operated only 3 weeks in January owing to conditions in the copper industry and low metal prices. The plant is reported to be ready to resume operations on short notice. The average cost of production for the company was reduced from 11.45 cents a pound in 1937 to 9.50 cents in 1938, but as the average selling price fell from 12.375 to 9.80 cents there was a decline in the net realization per pound. Operations of the company for 5 years are shown in the following table.

*Copper produced by the Champion mine of the Copper Range Co., 1934–38*

| Year | Rock stamped | Copper produced | Yield per ton | Cost per pound [1] | Price received |
|---|---|---|---|---|---|
| | *Short tons* | *Pounds* | *Pounds* | *Cents* | *Cents* |
| 1934 | 241,175 | 13,929,859 | 57.76 | 8.69 | 8.55 |
| 1935 | 280,500 | 16,759,889 | 57.56 | 8.26 | 8.68 |
| 1936 | 320,815 | 17,486,019 | 54.51 | 8.87 | 9.59 |
| 1937 | [2] 306,075 | 16,131,277 | [3] 51.59 | 11.45 | 12.375 |
| 1938 [4] | 333,190 | 18,066,891 | 54.06 | 9.50 | 9.80 |

[1] Excludes depreciation and depletion.
[2] Excludes 133,594 tons of tailings treated.
[3] Yield from ore only.
[4] Includes Globe mine.

| Average value per ton of galena concentrates | $42.91 | $50.00 | $68.42 | $55.29 |
| Average zinc content of sphalerite concentrates.....percent | | 45.0 | 51.6 | |
| Average value per ton of sphalerite concentrates | | $18.00 | $30.00 | |

The value of the silver, lead, and zinc shipped from Missouri mines was $12,396,948 in 1938 compared with silver, copper, lead, and zinc valued at $21,482,555 in 1937. The silver in 1938 (292,000 ounces) was recovered from lead refining; lead ore yielded no copper. The quantity of recovered lead decreased from 157,631 tons in 1937 to 122,027 tons in 1938 and that of recoverable zinc from 20,600 to 10,226 tons.

Shipments of lead concentrates (of which only 104 tons in 1938 and 173 tons in 1937 were lead carbonate) from Missouri mines were 167,734 tons compared with 215,697 tons in 1937; of the total, 163,500 tons were shipped from mines in southeastern Missouri compared with 209,937 tons in 1937, and the recovered lead content in southeastern Missouri was 118,870 tons in 1938 and 153,205 tons in 1937. No sphalerite was shipped in 1938 from southeastern Missouri. Shipments of lead concentrates from southwestern Missouri mines in 1938 comprised 4,130 tons of galena and 104 tons of lead carbonate; most of the galena concentrates were from mines in the Spring City, Oronogo, and Diamond camps.

The total value given for all concentrates is based on actual receipts by the sellers and not on quoted prices. In 1938, as in 1937, the quoted price was that paid for medium quantities or carload lots; small lots brought less.

The quoted price for 80-percent galena concentrates for the first 4 weeks of 1938 was $55 a ton. Early in February it declined to $49.43 and in April to $49 where it was pegged for 8 weeks. At the end of May the price declined further to $42.14, which held for 4 weeks. Late in June the quotation advanced to $49.34 and on the first of July to $55.10, which held for 9 weeks. In September the price advanced to $57.98 where it remained about 10 weeks. The quotation dropped late in November to $56.64 and in the first week in December to $52.94. The price during the last 2 weeks of 1938 was $54.38.

The quoted price of coarse sphalerite concentrates in 1938 ranged from $27.50 to $33.50 a ton. The opening quotation was $31.50, and in the sixth week the price declined to $29.50, which held for 6 weeks. At the end of March the quotation was $28.50, and early in April it dropped to as low as $27.50 where it stayed until the end of June. Early in July the price advanced to $30 where it was steady for 12 weeks. There was an upward swing in September, quoted prices reaching $31.50 in September and $32.50 in October. The high price of 1938 ($33.50) was reached early in November. News of the reduced import duty on zinc promptly caused a decline to $31 and then to $29, the quoted price for the last 4 weeks of 1938.

No prices were quoted for zinc silicate or lead carbonate concentrates. Flat purchase rates for the year were $31.14 a ton for

Digitized by Google

lead carbonate and $17.54 for zinc silicate concentrates. There was no great demand for zinc silicates in 1938, and the production was only 1,022 tons.

The foregoing quoted prices apply to all mines in the Tri-State or Joplin region of Kansas, Missouri, and Oklahoma.

Few drill rigs were operated in the region in 1938, and most of them were in the old camps in southwestern Missouri. Development was most active in the Oronogo, Neck City, Waco, Stark City, and Joplin areas.

Of the 361,526 tons of zinc concentrates shipped from the Tri-State region in 1938, it is estimated that flotation concentrates comprised about 171,400 tons. Flotation galena concentrates are estimated at 8,800 tons. Since the extension of flotation the average grade of the galena concentrates has decreased, whereas that of the sphalerite has increased. Some of the galena from the jigs and tables has a lead content of 80 percent (and above), but the flotation galena does not average more than 70 percent. The small quantity of galena produced at tailing mills is of low grade, averaging 48 to 65 percent. About 50 large and small mines were worked in southwestern Missouri in 1938; only 16 mills were operated.

Small mining operations and churn drilling were handicapped by low prices for ore, and the work done was not particularly successful in most areas. Small bodies of ore were located but few of any size. A drilling campaign was started at the old Aurora camp in an endeavor to revive mining in that vicinity, which has been at a standstill for several years. The only fair-size body of good-grade ore was drilled by the Eagle-Picher Mining & Smelting Co. at Stark City. A shaft was sunk and ore shipped to the Central mill at Cardin, Okla., in December 1938. Another shaft is being sunk and drilling continued. Shipments of crude ore from this property probably will exceed 1,500 tons a week in 1939. An undertaking that involved good engineering and a large expenditure of money was that at the old Oronogo Circle mine, which has yielded ore worth many millions of dollars. Power shovels and trucks have been removing shale and waste from the large open cave and old underground workings. The work, which is being done by the Oronogo Mutual Mining Co., is still in progress, but late in December ore was being taken from open-cuts and trucked to a 250-ton concentrating plant built by the Eagle-Picher Mining & Smelting Co. to handle this ore and that of other mines at Oronogo, Neck City, and Alba.

Among the larger producers of concentrates in southwestern Missouri in 1938 were the Missouri Mining Co. at Chitwood and Mineral Recoveries at Webb City, both of which operate tailing mills. Large producers from crude ore were the Oronogo Mutual Mining Co., D. C. & E. mine, and F. M. Mining Co., at Oronogo; Federal Mining & Smelting Co., Spring City; Playter Mining Co., Waco; Burton Mining Co., Joplin; United Mines, Inc., Diamond; Webb City Lead-Zinc Co., Webb City; United Zinc & Lead Co. and Little Phoebe, Wentworth; and Mary Arnold Mining Co., Ozark. The largest shippers of zinc silicate were Pilant & Ogle of Granby. About 119,400 tons of crude ore from Missouri mines were shipped to the Central mill at Cardin, Okla. Other smaller producers were the Ritter Mining Co., Pflug

Digitized by Google

Mining Co., Happy Hollow Mining Co., Luther Eakins, and Sterling Lead-Zinc Co.

The lead ore (3,668,400 tons) mined in 1938 in southeastern Missouri yielded 4.45 percent in galena concentrates averaging 74.8 percent lead. The mines and mills of the St. Joseph Lead Co., with a daily capacity of 20,500 tons, were operated at about 75 percent of capacity in 1938 and the Mine La Motte Corporation mine and mill at about the same rate. The Annapolis mine and mill in Iron County were operated part of the year by the Basic Metals Mining Co. The Ozark Lead Co. worked the Fleming tract at Fredericktown about 6 months in 1938. The crude ore was milled at the Clark & Hallock Milling Co. plant which was built in 1938. Mining was done on the 93-foot level, and the galena recovered was satisfactory in quantity and grade. Of the concentrates made at mills in southeastern Missouri, 73,884 tons were flotation galena concentrates in 1938 compared with 98,137 tons in 1937.

*Oklahoma.*—The most important event in Oklahoma and in the Tri-State lead and zinc region was the purchase by the Eagle-Picher Mining & Smelting Co. of virtually all of the 55,000 shares of the Commerce Mining & Royalty Co. The purchase was completed December 28, 1938, after many months of negotiations and a complete survey of all the Commerce properties. Eagle-Picher is now in possession of all lands, leases, mills, supplies, and equipment, as well as the large electric-power plant, of the company. The Northeast Oklahoma Ry. Co., which has numerous loading points in the Kansas and Oklahoma parts of the Tri-State region, will be operated by Eagle-Picher. The purchaser acquired large reserves of ore needed for its many integrated operations and an ample supply of crude ore for its 10,000-ton (daily) Central mill at Cardin. The field operating offices of the Eagle-Picher mine have been moved to Miami and Cardin. It is expected that the revamped Central mill, with its differential-tension density cone in good working condition, will be brought up to capacity and that the increased quantity of ore handled at that plant will permit the dismantling of several smaller mills. The large stocks of galena held by Commerce have been shipped to the Galena (Kans.) smelter. Little drilling was done in Oklahoma in 1938 for, although the ore reserves of many mines are nearing exhaustion, prices paid for concentrates have been too low to permit much money to be spent for exploration or development. Even if new bodies of ore are located it is improbable that any new milling plants will be constructed, as existing mills can handle more crude ore than is being mined.

About 30 mills of various sizes were operating in Oklahoma at the end of 1938. At least 65 operators did not mill their crude ore but shipped it to custom concentrating plants or central mills. The Tri-State Zinc & Lead Ore Producers Association reported that at the end of 1938 the stocks at mines in the Tri-State region were 8,402 tons of sphalerite and 8,620 tons of galena; all but 900 tons of the galena was shipped in January 1939, so that the total stocks of concentrates in mine bins were down to a little more than a week's demand over the current weekly output.

A large part of the concentrates from the tailing mills and from the central mills is a flotation product. The tailing mills produce very small quantities of low-grade galena, and the flotation galena at the

Digitized by Google

large mills treating crude ore is of lower grade than the jig and table galena; on the other hand, much of the flotation sphalerite made is of higher grade than the coarse concentrates.

Nearly 1,177,000 tons more old tailings than crude ore were treated in Oklahoma in 1938, and the tailings yielded 20 percent of the sphalerite.

There was no production from the Peoria or Davis camps in 1938 or 1937. Mines near Commerce were operated part of the year, and the Cactus and Lost Trail leases produced galena and sphalerite at small mills or shipped crude ore to custom mills. The shippers in the Sunnyside-Quapaw area were the Kansas & Oklahoma Mining Trust, Atlas Milling Co., Century Zinc Co. (Scott), and St. Louis Smelting & Refining Co. (No. 4). In the central and western parts of the Oklahoma section of the Tri-State region the following mills were run partly on ore and partly on tailings: Lawyers Lead & Zinc Co., Skelton Lead & Zinc Co., Evans Wallower Zinc, Inc., and Rialto Mining Corporation. The following mills treated tailings only: Cardin Mining & Milling Co. (Nos. 2 and 3), Commerce Mining & Royalty Co. (Beaver), Britt Mining Co., Tri-State Zinc, Inc. (two mills), Andrews Mining & Milling Co., Cortez King Brand Mining Co., and C. Y. Semple. The Eagle-Picher Mining & Smelting Co.—Central and Mary M. Beck mills—treated more crude ore than any other operator in the region; its mills and the Bird Dog, See Sah, and Blue Goose mills of the Commerce Mining & Royalty Co. treated about two-thirds of all the Oklahoma crude ore milled in 1938. Other large outputs were made by the Rialto Mining Corporation, Evans Wallower Zinc, Inc. (No. 4), Oklahoma Interstate Mining Co. (Woodchuck), United Zinc Smelting Corporation, Kansas Exploration Co. (Ritz), Guaranty Mining & Royalty Co., Cortez King Brand Mining Co. (New York and Oberman mines), Indian Mining & Milling Co., Black Mining Co., Lula Belle Mining Co., Baird Mining Co., Blue Ribbon Mining Co., Federal Mining & Smelting Co. (Gordon), and Lavrion Mining Co.

Some of the larger shippers in Oklahoma to custom or central mills were the Davis Big Chief Mining Co., Craig Mining Co., Cameron & Henderson, J. Dryer, Henderson Mining Co., Andrews Mining Co., Childress Mining Co. (Acme), Southeastern Mining Co. (Hope), New Deal Mining Co., Romo Mining Co., Tongaha Mining Co., Gray Wolf Mining Co., and Needmore Mining Co. The Bird Dog mill received ore from many of the leases belonging to the Commerce Mining & Royalty Co., including the Anna Beaver and Scammon Hill mines. Virtually all the tailings treated were handled by gasoline power shovels, the remainder by draglines. The new 1,200-ton Gordon mill of the Federal Mining & Smelting Co., which was completed in November 1937, treated all ore mined by the company in Oklahoma. The Mary M concentrating plant received custom ores from 8 mines, and the Royal plant from about 10 mines including the Mary Alice, Hope, Aztec, and Indiana.

[1] Including Quapaw and Sunnyside.

*Wisconsin.*—The output of galena concentrates in 1938 in Wisconsin was less than one-third of that in 1937. Shipments of sphalerite decreased substantially, and the grade of the raw concentrates was lower; the recovered zinc decreased 4,865 tons. About half the raw concentrates were treated at the Cuba City roasting plant, which was

Digitized by Google

abandoned early in 1938, and the rest were treated at a flotation plant built in 1938. The Vinegar Hill Zinc Co. worked the Mullen No. 2 and Winskill-Petersen mines 90 days, closing them in March 1938. Small lots of crude ore were shipped to the Vinegar Hill concentrating plants from about 30 small mines at Shullsburg, New Diggings, Linden, Highland, Hazel Green, Dodgeville, Cuba City, and Benton. The shippers included the McKinley Mining Co., which did not operate its mill in 1938. The Pacquette mine at Shullsburg, operated by C. J. Rodham, produced no ore, but a new shaft was sunk and flotation equipment was added to the concentrating plant.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN IDAHO

(MINE REPORT)

By T. H. MILLER AND PAUL LUFF

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 335 | Metallurgic industry | 341 |
| Calculation of value of metal production | 335 | Review by counties and districts | 346 |
| Mine production by counties | 339 | Coeur d'Alene region | 355 |
| Mining industry | 340 | | |
| Ore classification | 341 | | |

The total value of the metal output from mines in Idaho in 1938 decreased $8,812,081, or 23 percent, from that in 1937. The value of the lead output declined $3,757,614; silver, $2,872,397; zinc, $2,818,990; and copper, $120,900. The value of the gold output increased $757,820. The decreases in average sales prices of lead, silver, and zinc in 1938 caused curtailment or suspension of operations at the large zinc-lead properties in the Coeur d'Alene region, the chief metal-producing area in Idaho; however, the output of zinc-lead ore from the Warm Springs district in Blaine County increased 51 percent. Production of gold in Idaho in 1938 (103,513 fine ounces) was the largest since 1896, owing to increased output from both lode mines and placers, and that of silver (18,993,676 fine ounces) was only 3 percent less than the record output of 1937; but the output of zinc declined 19 percent and that of lead 11 percent.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

[1] Power-shovel excavators with floating washing plants or special amalgamators.
[2] Figures for sluicing and hydraulic include those for drift mining.

*Gold.*—The output of recoverable gold in Idaho was 26 percent greater in 1938 than in 1937 and was the largest since 1896 when it was 112,409 ounces. Gold output from lode mines increased 20 percent and that from placers 33 percent; most of the gain in gold from placers came from dragline operations. About 52 percent of the State total gold output in 1938 came from placer operations; 30 percent of the total lode and placer was recovered by connected-bucket dredges and 17 percent by dragline dredges. Nine floating (bucket) dredges treated a total of 6,693,700 cubic yards of gravel and recovered 31,234 ounces of gold, an increase of 2,272 ounces over 1937; and 19 dragline dredges treated a total of 2,173,000 yards of gravel and recovered 17,448 ounces of gold, an increase of 10,589 ounces. Of the total placer gold, 82 percent came from the Boise Basin, Warren, Carson, Newsome, and West View (Gem County) districts where dredges were operated. Gold from placer and lode

Digitized by Google

operations in the Boise Basin district comprised 26 percent of the State total. About 79 percent of the lode gold came from the Boise Basin, Marshall Lake, Middle Boise, Warm Springs, Yellow Pine, Ten Mile, Ramey Ridge, Mineral Hill, and Orogrande districts and the Coeur d'Alene region. Increases in gold were recorded in the Middle Boise, Warm Springs, Mineral Hill, Ramey Ridge, and Ten Mile districts, but decreases in the Seven Devils and Yellow Pine districts. Siliceous gold ore and old tailings yielded 39 percent of the total gold in 1938.

The Fisher-Baumhoff Co., operating two bucket dredges near Centerville, was again the largest gold producer in Idaho. It was followed by the Moores Creek Dredging Co. at Idaho City; the Golden Anchor mine at Burgdorf; the Warren Dredging Co. at Warren; Newsome Creek Placers near Golden; the Jordan Creek dredge at De Lamar; the Triumph (Snyder Mines, Inc.) mine near Hailey;

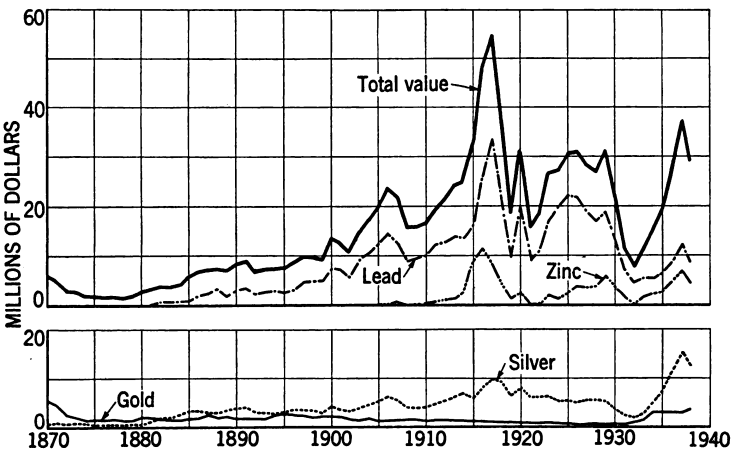

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1938. The value of copper has been less than $2,000,000 annually except in a few years.

Ralph Davis, Inc. (dredge), at Montour; the Yellow Pine Co. at Stibnite; the Mayflower mine at Placerville; and the Boise-Rochester property at Atlanta.

*Silver.*—The output of recoverable silver in Idaho was 18,993,676 fine ounces in 1938, a decrease of 3 percent from the record output of 1937. Virtually all the large producers of silver in the Coeur d'Alene region reported decreases except the Polaris mine which reported a substantial gain. There was also a substantial increase in silver output from the Warm Springs district. The Coeur d'Alene region produced 91 percent of the State total silver in 1938; the remainder came chiefly from the Warm Springs, Bayhorse, Blue Wing, Pend d'Oreille, Boise Basin, Carson, and Middle Boise districts. Silver ore yielded 72 percent of the State total silver, zinc-lead ore 19 percent, and lead ore 8 percent. Production of silver from silver ore decreased 519,213 ounces and that from lead ore also decreased, but the output from zinc-lead ore increased 469,709 ounces.

Digitized by Google

The Sunshine mine, largest producer of silver in the United States, decreased its output from 12,152,000 ounces in 1937 to 11,352,154 ounces in 1938. Eight mines—the Sunshine, Polaris, Bunker Hill, Hecla, Triumph, Morning, Crescent, and Page—produced 94 percent of the silver output of the State in 1938. All these mines, except the Triumph, are in the Coeur d'Alene region.

*Copper.*—The output of recoverable copper in Idaho was 4,278,000 pounds in 1938, a decrease of 4 percent from 1937. Mines in the Coeur d'Alene region produced 88 percent of the total (nearly 72 percent from silver ore, 12 percent from zinc-lead ore, 4 percent from lead ore, and a little from gold ore); 5 percent came from gold ore from the McDevitt and Ramey Ridge districts. The Sunshine mine produced more than half the State total copper in 1938; most of the remainder came from the Polaris, Bunker Hill, Copper Queen, and Morning mines.

*Lead.*—The output of recoverable lead in Idaho was 184,354,000 pounds in 1938, a decrease of 11 percent from 1937. More than 89 percent of the total came from the Coeur d'Alene region and 8 percent from the Warm Springs district; considerable lead was produced also in the Bayhorse, Pend d'Oreille, Port Hill, and Texas districts. Zinc-lead material from the Coeur d'Alene region and the Warm Springs district yielded 75 percent of the State total lead in 1938; lead ore, chiefly from the Coeur d'Alene region, yielded 23 percent. Lead recovered from lead ore decreased 20,895,011 pounds and that from zinc-lead material 2,611,776 pounds. The combined lead output of the three largest producers—Bunker Hill, Hecla, and Morning—was 134,740,600 pounds, or 73 percent of the State total; other large producers of lead were the Triumph, Page, Star, Sherman, Gold Hunter, Blackhawk, Clayton, and Jack Waite properties.

*Zinc.*—The output of recoverable zinc in Idaho was 88,060,000 pounds in 1938, or 19 percent less than the record output of 1937. The decrease was due entirely to curtailment of operations at zinc-lead mines in the Coeur d'Alene region, as the output of zinc from the Warm Springs district increased from 13,918,000 pounds in 1937 to 24,140,000 pounds in 1938. More than 72 percent of the State total zinc in 1938 came from the Coeur d'Alene region and nearly all the remainder from the Warm Springs district. Three mines—the Morning, Triumph, and Bunker Hill—produced 77 percent of the State total, and the rest came chiefly from the Star, Frisco, Page, and Hecla mines. Zinc-lead ore and old tailings yielded 99 percent of the total and lead ore the remainder.

[1] Power-shovel excavators with floating washing plants or special amalgamators.
[2] Recovered from 2,713,000 cubic yards of gravel treated by 19 dragline dredges.
[3] Recovered from 6,693,700 cubic yards of gravel treated by 9 connected-bucket dredges.

## MINING INDUSTRY

The average sales prices of both lead and zinc dropped rapidly during the first half of 1938, and although prices strengthened somewhat during the latter half of the year the yearly averages were considerably lower than in 1937; lead was off 1.3 cents a pound and zinc 1.7 cents. These declines, combined with the reduction in the silver price to 64.6+ cents an ounce, resulted in curtailment in output of silver, lead, and zinc by virtually all the large mines in the Coeur

Digitized by Google

d'Alene region. Production of zinc in Idaho decreased 19 percent in quantity and 40 percent in value; lead, 11 and 31 percent, respectively; and silver, 3 and 19 percent, respectively. The decreases in output of metals in the Coeur d'Alene region were offset in part by a large increase in output of zinc-lead ore from Blaine County and by increases in gold from both lode mines and placers.

## ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in Idaho in 1938, with content in terms of recovered metals*

| Source | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Dry and siliceous gold ore | 189 | 283,204 | 40,305 | 130,287 | 250,190 | 242,496 | ---------- |
| Dry and siliceous gold-silver ore | 16 | 15,672 | 2,123 | 90,692 | 1,631 | 205,342 | ---------- |
| Dry and siliceous silver ore | 28 | 444,456 | 1,065 | 13,599,812 | 3,142,508 | 1,835,028 | ---------- |
| | [1] 232 | 743,332 | 43,493 | 13,820,791 | 3,394,329 | 2,282,866 | ---------- |
| Copper ore | 9 | 165 | 58 | 1,339 | 34,361 | 665 | ---------- |
| Lead ore | 55 | 272,904 | 831 | 1,449,666 | 221,385 | 42,665,859 | 643,000 |
| Zinc-lead ore | 23 | 982,746 | 5,052 | 3,704,552 | 627,925 | 139,404,610 | 87,417,000 |
| Total, lode mines | [1] 305 | 1,999,147 | 49,434 | 18,976,348 | 4,278,000 | 184,354,000 | 88,060,000 |
| Total, placers | 463 | ---------- | 54,079 | 17,328 | ---------- | ---------- | ---------- |
| Total, 1937 | 768 | 1,999,147 | 103,513 | 18,993,676 | 4,278,000 | 184,354,000 | 88,060,000 |
| | 1,088 | 2,075,402 | 81,861 | 19,587,766 | 4,464,000 | 207,422,000 | 108,398,000 |

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

## METALLURGIC INDUSTRY

Of the 1,999,147 tons of ore (including old tailings) produced in 1938 in Idaho, 186,163 tons (9 percent) were treated at amalgamation and cyanidation mills, 1,779,815 tons (89 percent) were treated at concentration plants, and 33,169 tons (2 percent) were shipped for smelting.

The ore treated at amalgamation and cyanidation mills comprised 12,490 tons treated at straight amalgamation plants, yielding 2,458 ounces of gold and 730 ounces of silver; 59,987 tons treated at combined amalgamation and concentration plants, yielding 11,001 ounces of gold and 5,581 ounces of silver in amalgamation bullion and 616 tons of concentrates; and 113,686 tons treated at straight cyanidation plants. The ore treated at the cyanidation plants contained 4,270 ounces of gold and 3,109 ounces of silver, indicating cyanide extractions of 67 percent of the gold and 60 percent of the silver; the plants used 106,676 pounds of sodium cyanide (91-percent grade), 13,808 pounds of zinc dust, and 600,725 pounds of lime.

The ore treated at concentration plants comprised 93,911 tons of gold ore, 13,105 tons of gold-silver ore, 437,366 tons of silver ore, 252,687 tons of lead ore, and 982,746 tons of zinc-lead ore.

Details of the treatment of all ores produced in Idaho in 1938 are given in the tables that follow.

[1] Includes counties and districts with production valued at less than $350.

Digitized by Google

### ADA COUNTY

The metal output of Ada County increased slightly in 1938; most of it was gold recovered from the New Deal & Hot Shot and Gold Flour placers on Snake River near Grand View and from gold ore treated by amalgamation and concentration at the Adelmann Bros. mine in the Black Hornet district. Placer operations were reported also in the Boise and Highland districts, and gold ore was shipped for smelting from a property on Blacks Creek.

### ADAMS COUNTY

The value of the metal output of Adams County decreased from $149,869 in 1937 to $12,241 in 1938 owing to suspension of operations late in 1937 at the 25-ton cyanidation plant at the Placer Basin mine in the Seven Devils district; the Placer Basin Co. worked the mine in 1937 but ceased operations at the end of the year and dismantled the cyanide plant. The mine was operated 4 months in 1938, and 4 cars of gold ore were shipped to a smelter. The remainder of the county output in 1938 was chiefly copper ore from the River Queen, Lockwood, and Helena properties in the Seven Devils district.

### BLAINE COUNTY

The value of the metal output of Blaine County increased from $1,842,899 in 1937 to $2,711,107 in 1938, owing almost entirely to increased output of zinc-lead ore from the Triumph and North Star mines in the Warm Springs district operated by Snyder Mines, Inc. In 1938 the company shipped 103,746 tons of zinc-lead ore to flotation plants at Bauer and Tooele, Utah, compared with about 68,000 tons in 1937; in addition, 2,380 tons of siliceous ore from the Triumph mine were shipped in 1938 for smelting. Aside from the four chief districts in the Coeur d'Alene region, the Warm Springs district was by far the most important producing area in Idaho. The Triumph mine ranked second in output of zinc in Idaho in 1938, fourth in lead, and sixth in silver. Other producers in Blaine County in 1938 included the Jupiter & Garfield property in the Little Wood River district; the Treasure Vault, Bellevue, Red Elephant, Gold Bottom, Red Leaf, Happy Day, Daisy, Champlain, and Red Rock mines in the Mineral Hill district; and the Vienna mine in the Sawtooth district.

### BOISE COUNTY

*Boise Basin district (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).*—The Boise Basin district continued in 1938 to be the chief gold-producing area in Idaho. Four floating bucket dredges treated 4,236,665 cubic yards of gravel in 1938 and recovered 18,549 ounces of gold, compared with 17,438 ounces in 1937. The Fisher-Baumhoff Co., which operated two bucket dredges (one equipped with seventy 2½-cubic foot buckets and the other with eighty 6-cubic foot buckets) near Centerville, was again the largest producer of gold in the State. Other large producers included the Moores Creek Dredging Co. operating a dredge equipped with seventy-two 7½-cubic foot buckets at Idaho City, the Grimes Co. operating a dredge equipped with seventy-two 3½-cubic foot buckets at Pioneerville, and the Lord & Bishop Co.

Digitized by Google

operating a 3-cubic yard dragline and floating washing plant on Fall Creek. Considerable gold was recovered by hydraulic mining at the Leary-Brogan, Gold Hill, Packer, and Morning Star properties. The lode output of the district in 1938 was chiefly gold ore from the Mayflower and Gold Hill & Iowa properties. The Texas-Owyhee Mining & Development Co. operated the Mayflower mine near Placerville continuously and treated 19,712 tons of gold ore by flotation concentration. Talache Mines, Inc., operated the Gold Hill & Iowa mine the first 5 months of the year and treated 9,985 tons of gold ore by amalgamation, a decided decrease from the 31,563 tons treated in 1937; the mine was closed in May 1938 and the staff transferred to the company mine at Atlanta, Elmore County. The Come Back Mining Co. operated its mine at Pioneerville throughout 1938 and shipped high-grade gold-silver ore to a smelter. Most of the remainder of the district lode output was gold ore from the Hay Fork, Mountain Chief, Enterprise-Baby, and Mascot mines. Other producing lode mines in Boise County in 1938 included the Birthday mine on Eight Mile Creek; the Grandview, Homestake, Koon Dog, and K. C. mines near Grimes Pass; the Packer John property in the North Fork district; the Golden Cycle and Jessie mines in the Summit Flat district; and the Comeback mine in the West View district. The marked decrease in output from the Summit Flat district was due to suspension of operations by the Golden Cycle Mining Corporation late in 1937.

### BONNER COUNTY

Most of the output from Bonner County in 1938 was lead-silver ore, concentrated by flotation, from the Hope (Elsie K.) and Whitedelf properties in the Pend d'Oreille district. The output of ore from the Hope mine was less than half that in 1937, but the output from the Whitedelf increased. Rich silver ore from the Brown Bear, Katherine, Nameloc, and Talache mines, all also in the Pend d'Oreille district, was shipped to a smelter. The output from the Lakeview district decreased decidedly as the Keep Cool mill was not operated; the entire output was mill cleanings from former operations.

### BONNEVILLE COUNTY

The metal output of Bonneville County in 1938 was chiefly placer gold recovered by hydraulic and sluicing operations at the McCoy Creek, Rosanna, and James properties in the Mt. Pisgah district.

### BOUNDARY COUNTY

Virtually all the output of Boundary County in 1938 was lead-silver ore from the Idaho Continental mine in the Port Hill district; several thousand tons of ore were treated in a 50-ton flotation plant.

### BUTTE COUNTY

The output from Butte County in 1938 was crude ore shipped for smelting and comprised silver ore from the Hornsilver and Hub mines in the Lava Creek district and lead ore from the Great Western mine in the Dome district.

Digitized by Google

### CAMAS COUNTY

The increase in output of gold in Camas County in 1938 resulted from operation by the Baumhoff-Fisher Co. of a bucket dredge, equipped with sixty 4-cubic foot buckets, on Little Smoky Creek, and from production of gold ore at the Five Points mine north of Fairfield in the Little Smoky district.

### CLEARWATER COUNTY

The output of gold from Clearwater County decreased 1,098 ounces in 1938 owing to suspension of operations at the bucket dredge (64 buckets of 4 cubic feet capacity) on Rhodes Creek, operated in 1937 by Gold Dredging, Inc., and at the dragline and washing plant on Quartz Creek, operated in 1937 by Jett-Ross Mines, Inc. The chief production in the county in 1938 was gold ore from the Silver Creek mine in the Pierce district, where the Silver Creek Gold Mining Co. completed a 50-ton cyanide plant and treated 5,803 tons of gold ore during the latter half of the year. The largest producer of placer gold in the county was the Gold Creek Placer Co., operating a dragline dredge on Orofino Creek in the Pierce district; the dredge operated only a few months.

### CUSTER COUNTY

In 1938, as usual, the Bayhorse district was the chief producing area in Custer County, but the value of the district metal output decreased $84,648 from 1937 owing to the decrease in silver from the Ramshorn property that more than offset an increase in silver from the Clayton mine. The Clayton mine and 100-ton flotation mill were operated the entire year by Clayton Silver Mines, and about 39,000 tons of lead ore were milled compared with 28,700 tons in 1937; lead concentrates rich in silver were shipped to Utah for smelting. Silver in crude ore shipped from the Ramshorn mine for smelting decreased nearly 61,000 ounces in 1938. Other producing lode mines in Custer County in 1938 included the White Knob, Bluebird, Ausich, and Horseshoe in the Alder Creek district; the Copper Basin in the Copper Basin district; the Homestake near Stanley; and the Snowdrift, Peak, New Light, and Sunbeam in the Yankee Fork district. Most of the placer output of the county came from Stanley Creek Placers near Stanley and the Gold Bar property in the Yankee Fork district.

### ELMORE COUNTY

The value of the metal output from the Middle Boise (Atlanta) district increased from $94,546 in 1937 to $231,439 in 1938. Virtually the entire production came from two properties—the Boise-Rochester mine operated by Talache Mines, Inc., and the Atlanta property operated by the Last Chance Mining Co. Each company treated about 8,000 tons of gold ore by amalgamation and concentration, and each shipped several hundred tons of rich gold ore for smelting. Other producing lode mines in Elmore County in 1938 included the Hunter, Empire, and Big Water in the Bear Creek district; the Homestake and Flat Creek in the Neal district; and the Elk Horn at Pine Grove. The Feather River Placer Mining Co. installed experimental equipment at a placer in the Bear Creek district and treated 21,000 cubic yards of gravel. The Northwest Gold Mining

Digitized by Google

Co. treated 56,000 cubic yards of gravel from the Rose placer on Snake River near King Hill; the company operated a gas-powered shovel and a special screening and washing plant.

### GEM COUNTY

Production of gold in Gem County increased from 759 ounces in 1937 to 4,049 ounces in 1938. Ralph Davis, Inc., the chief producer, operated a dragline and floating washing plant at the Gatfield & Montour property in the West View district. Nearly all the output from lode mines was high-grade gold-silver ore from the Lulu and Black Rock claims.

### IDAHO COUNTY

*Camp Howard (Salmon River) district (White Bird).*—Gold recovered from placer operations in the Camp Howard district increased considerably in 1938. Most of it came from a dragline operation at the Large Bar; other producers included the Pine Bar, Klondyke, Horseshoe Bend Bar, and Olney placers.

*Dixie district.*—The ¾-cubic-yard dragline dredge at Dixie Placers was idle in 1938, resulting in a decrease in gold production in the Dixie district. Most of the district output was gold ore from the Mammoth mine, concentrated by flotation, and placer gold recovered by dragline dredges at the Salmon River Placer and Alpha properties.

*Elk City district.*—Production of gold in the Elk City district increased more than 1,000 ounces in 1938 owing to operation of a 1½-cubic-yard dragline and washer at the Marr-Witter property by the American River Mining Co. The company was organized early in the year and became a large producer of gold. Other fairly large producers of placer gold were the Little Million, Columbus, Deadwood, and Gold Hill properties. The Mount Vernon Co. operated its dredge, equipped with sixty-six 2-cubic-foot buckets, a short time at the Deadwood claim and then moved it to a property on upper Crooked River in the Orogrande district. The chief producers of lode gold were the Grangeville and Madre d'Oro mines.

*Florence district.*—Nearly the entire output of the Florence district in 1938 was placer gold; the largest producer was the Meadow Creek claim, operated by a dragline dredge.

*Marshall Lake district (Burgdorf).*—The most important metal production in the Marshall Lake district in 1938 was gold recovered from gold ore at the Golden Anchor mine. The Golden Anchor Mining Co. operated the mine the entire year and treated 10,432 tons of ore in a 50-ton amalgamation and flotation plant; it was the largest producer of lode gold in the State, but its output was less than in 1937. Placer operators in the district recovered 222 fine ounces of gold in 1938; the chief producers were the Laughing Water, Idaho Klondike, Golden Rule, and Mary Jane claims.

*Newsome district.*—The output of gold in the Newsome district was 4,743 ounces in 1938, compared with 832 ounces in 1937. The large gain resulted from steady operation of the dragline and washing plant on Newsome Creek by Ferris & Marchbank (Newsome Creek Mining Co.); the dredge treated 634,933 cubic yards of gravel from April 5 to November 30 and ranked fifth in the State as a gold producer.

*Orogrande district.*—Production of gold from lode mines in the Orogrande district decreased in 1938 but that from placers increased.

Digitized by Google

The Orogrande-Frisco Gold Mines, Inc., continued to be the largest producer of gold in the district; it treated 105,983 tons of low-grade gold ore in a 500-ton cyanide plant and recovered 1,917 fine ounces of gold and 1,076 fine ounces of silver. The district output of placer gold (397 ounces) was recovered chiefly by bucket dredging by the Mount Vernon Mining Co. (capacity of dredge given under Elk City district) and sluicing operations at the Baker Gulch property.

*Ramey Ridge district.*—The value of the metal output of the Ramey Ridge district increased to $99,708 in 1938 owing to the large gain in output of gold ore from the Snow Shoe mine north of Big Creek. The Pierce Metals Development Co. operated the mine throughout the year and treated 5,238 tons of ore in a 25-ton concentration plant; the entire plant was destroyed by fire in January 1939. Nearly all the remainder of the district output was gold ore from the Hand property, treated by amalgamation.

*Robbins (Buffalo Hump) district.*—The operation of the St. Louis mine by lessees resulted in a large increase in production of gold in the Robbins district in 1938; several thousand tons of gold ore from the mine were treated by concentration at a custom mill at Elk City. The remainder of the district output was chiefly old tailings (gold) from the Jumbo dump, treated by cyanidation.

*Salmon River (Riggins and French Creek) district.*—Placer operations at Riggins and French Creek recovered 229 fine ounces of gold and 48 fine ounces of silver in 1938; the chief producer was the Morland Gold Corporation, operating the Shorts Bar at Riggins with hydraulic and sluicing equipment.

*Ten Mile district (Golden).*—The value of the metal output of the Ten Mile district increased from $56,001 in 1937 to $137,145 in 1938 owing to gains in output of gold from the Lone Pine and Blackbird lode mines and the Lena B-Komo placer. The Lone Pine mine was operated throughout the year and was again the largest producer in the district; about 8,000 tons of ore were treated by amalgamation and concentration. The Clearwater Mining Co. was organized early in the year to operate the Blackbird property, and from February 1 to December 22 about 5,000 tons of ore were treated by amalgamation and concentration. Dragline dredging operations at the Lena B-Komo placer were conducted from April 20 to August 7 by the Western Gold Corporation; the company treated 186,494 cubic yards of gravel and recovered 698 fine ounces of gold and 136 fine ounces of silver. The 2-cubic yard dragline and washing plant were moved in August to a property in Oregon. Most of the remainder of the district output was gold ore from the Shamrock, Red Wing, and Gold King mines.

*Warren district.*—The value of the metal output of the Warren district increased from $248,027 in 1937 to $300,889 in 1938; the chief production was placer gold recovered by two bucket dredges. The Warren Dredging Co. operated its dredge, equipped with seventy-five 3½-cubic foot buckets, nearly all of 1938 and treated 1,015,000 cubic yards of gravel; the company ranked fourth in Idaho as a gold producer. A dredge of the same size as the Warren dredge was operated by the Baumhoff-Fisher Co.; it treated 608,000 cubic yards of gravel from April 20 to November 11 and recovered 2,022 fine ounces of gold and 722 fine ounces of silver. Production of gold from lode mines in the district came chiefly from the Rescue and Little Giant (Unity) properties.

Digitized by Google

### JEROME COUNTY

The metal output of Jerome County in 1938 was placer gold and silver recovered by various operators along the banks of Snake River near Jerome and Murtaugh.

### LEMHI COUNTY

*Blue Wing district.*—In 1938, as in 1937, the entire output of the Blue Wing district was tungsten ore, containing appreciable silver, copper, and lead, from the Ima mine at May. The capacity of the mill was enlarged to treat 150 tons of ore a day, and a new Diesel compressor plant was installed; 26,823 tons of ore were treated by flotation and magnetic separation.

*Boyle and Carmen Creeks district.*—The Gibbonsville Mining & Exploration Co. constructed a 150-ton flotation plant at the Silver Star mine in 1938 and treated 2,778 tons of low-grade gold-silver ore.

*Eldorado district.*—No metal was produced in the Eldorado district in 1938, as the Ranger property, a large producer of gold in 1937, was not productive.

*Eureka district.*—Most of the output from the Eureka district in 1938 was gold ore from the Queen of the Hills mine, treated by amalgamation, and gold ore from the Starlight mine, shipped for smelting.

*Gibbonsville district.*—Most of the output from lode mines in the Gibbonsville district in 1938 was gold ore from the Twin Brothers mine, treated by concentration; nearly all the placer production was recovered by hydraulic and sluicing operations at the Sundown property by North Fork Placers.

*McDevitt district.*—All the output of the McDevitt district in 1938 was gold ore and old tailings from the Copper Queen property, treated by concentration; the Tendoy Copper Queen Syndicate operated the mine throughout the year and in December completed the construction of a new 50-ton flotation plant.

*Mackinaw district.*—Virtually the entire output from lode mines in the Mackinaw district in 1938 was gold ore from the Shoo Fly mine, treated by amalgamation and concentration. The chief placer producers were the K. G. W., Beaver Creek, and Richardson claims.

*Mineral Hill district.*—Production of gold in the Mineral Hill district was 2,238 ounces in 1938 compared with 245 ounces in 1937. The large gain was due to operation of the Grunter mine and to the increase in output of gold ore from the Gold Hill mine, both at Shoup. The Grunter mine was acquired in January by Gold Producers, Inc., and 6,725 tons of gold ore were treated during the year in the 50-ton flotation mill, formerly used to treat ore from mines at Gibbonsville but moved to Shoup in August; the mine was the largest producer of gold in Lemhi County in 1938. The Gold Hill mine and 100-ton flotation mill were leased in July by I. D. Theriault, and 3,650 tons of gold ore were treated by amalgamation and concentration.

*Pratt and Sandy Creeks district.*—The large increase in output of gold ore from the Goldstone mine on Pratt Creek resulted in a gain in the district gold production in 1938. The mine was operated the entire year by the Goldstone Mining Co., and several thousand tons of ore were treated by concentration. Gold ore was produced also from the Gem, Mendota, and Gray Eagle mines.

Digitized by Google

*Texas district.*—The value of the metal output of the Texas district decreased from $111,373 in 1937 to $33,398 in 1938 owing to the decline in shipments of lead-silver ore from the Silver Moon and Latest Out mines.

*Yellow Jacket district.*—Most of the output from the Yellow Jacket district in 1938 was gold ore from the Yellow Jacket mine, treated by concentration. The mine was operated under lease by the Treasure Gold Mining Co.; late in the year it was taken over by the Condor Gold Mining Co., controlled by the International Smelting & Refining Co.

### NEZ PERCE COUNTY

The entire metal output of Nez Perce County in 1938 was placer gold and silver recovered by various operators along the banks of Salmon and Snake Rivers.

### OWYHEE COUNTY

*Carson district (Silver City, De Lamar).*—There were large increases in production of gold in the Carson district in 1938 from both lode and placer properties; the chief output was placer gold recovered by two dredges near De Lamar. Jordan Creek Placers operated its dredge, equipped with sixty-two 3-cubic foot buckets, nearly all the year and treated 605,510 cubic yards of gravel; it was again the largest producer of gold in Owyhee County. Considerable gold was recovered also on Jordan Creek by De Lamar Placers, which operated a dragline and washing plant from March 23 to December 14 and treated 560,000 cubic yards of gravel. The increase in output of lode gold and silver resulted from milling operations at the Trade Dollar and Golden Sunday mines and the De Lamar old tailing dumps; the largest production was derived by concentration of several thousand tons of old tailings from the De Lamar dumps.

*Snake River district.*—Placer gold recovered from Snake River bars near Grand View decreased in 1938 owing to suspension of operations at the dragline dredge of the Triangle Construction Co. The chief producers were the Dollar claim near Hammett and the Murphy and Hightower claims at Grand View.

### POWER COUNTY

Production of gold in Power County was small in 1938, as the dragline dredge, which operated at Bonanza Bar on Snake River in 1937, was idle in 1938.

### SHOSHONE COUNTY

#### COEUR D'ALENE REGION

The value of the metal output of the Coeur d'Alene region decreased 31 percent in 1938. Most of the loss was in lead and zinc production and was due chiefly to suspension of operations at the Morning mine of the Federal Mining & Smelting Co. for 3 months during the summer and to closing of the Star mine of the Sullivan Mining Co. in July. The output of silver also decreased considerably owing to marked decreases at both the Sunshine and Crescent mines. The closing of the lead smelter at East Helena, Mont., for several months in the summer and fall resulted in shut-downs at several Coeur d'Alene

Digitized by Google

properties, and declining prices of lead and zinc caused curtailment by nearly all the large producers of zinc-lead ore. About 58 percent of the material produced in Shoshone County in 1938 was zinc-lead ore, 27 percent silver ore, and 14 percent lead ore. The following table gives production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region in 1937 and 1938 and the total for 1884 to 1938.

*Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1937–38, and total, 1884–1938, in terms of recovered metals*

| Year | Lode mines | Placers | Ore | Gold (lode and placer) | Silver (lode and placer) | Copper | Lead | Zinc | Total value |
|---|---|---|---|---|---|---|---|---|---|
| | | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* | |
| 1937 | 49 | 38 | 1,731,801 | 3,659 | 18,457,726 | 3,888,157 | 193,010,644 | 94,140,000 | $32,382,311 |
| 1938 | 43 | 20 | 1,514,278 | 4,053 | 17,325,379 | 3,765,795 | 164,547,979 | 63,874,125 | 22,346,313 |
| Total, 1884–1938 | ------ | -------- | (1) | 366,164 | 342,066,466 | [2] 49,541 | [2] 4,866,152 | [2] 636,899 | 854,563,102 |

[1] Figures not available.
[2] Short tons.

*Beaver district.*—The value of the metal output of the Beaver district declined from $344,534 in 1937 to $34,701 in 1938, owing chiefly to the large decrease in output of zinc-lead ore and old tailings from the Interstate-Callahan property, where operations were suspended in February after 3,900 tons of zinc-lead ore had been mined; the ore was treated in the Galena mill near Wallace.

*Coeur d'Alene district.*—Placer gold continued in 1938 to be the chief metal produced in the Coeur d'Alene district, but the output was less than in 1937; most of it was recovered by drift mining at the Beehive Bar, Grove Walker, and Old Dunn claims.

*Eagle district.*—Production of silver, lead, and zinc in the Eagle district in 1938 was about double that in 1937 owing to increase in output of zinc-lead ore and lead ore from the Jack Waite mine, the only producer. The property lies in both Shoshone County, Idaho, and Sanders County, Mont.; the output from the Idaho section of the mine comprised 7,795 tons of zinc-lead ore treated in the mill at Duthie and 221 tons of rich lead ore shipped for smelting.

*Evolution district.*—The value ($8,741,743) of the metal production of the Evolution district in 1938 was larger than that of any district in Idaho, although it was $1,789,309 less than in 1937. The chief production, as in 1937, was silver ore from the Sunshine and Polaris properties. The Sunshine Mining Co. was again the largest producer of silver in the United States; the company operated its 1,100-ton flotation mill continuously and treated 321,605 tons of silver ore, or 65,805 tons more than in 1937, but the output of silver declined from 12,152,000 ounces in 1937 to 11,352,154 ounces in 1938 as the silver content of the ore decreased. Development in 1938 comprised 8,695 feet of drifting, 2,198 feet of diamond drilling, 4,446 feet of raising, 3,038 feet of crosscutting, and 434 feet of sinking. The Polaris Mining Co. operated its 200-ton flotation mill throughout the year and treated 64,405 tons of silver ore, or about double the quantity in 1937; the company ranked third in Idaho in production of silver. The remainder of the district output comprised 1,220 tons of silver

Digitized by Google

ore from the Mineral Point mine and 180 tons of ore from the St. Elmo property.

*Hunter district* (*Mullan*).—The value of the metal output of the Hunter district declined from $7,691,893 in 1937 to $4,246,649 in 1938; production of silver decreased 337,099 ounces, lead 15,639,814 pounds, and zinc 15,260,683 pounds. These losses were due to decreases in output of ore from the four chief producers—the Morning, Star, Gold Hunter, and Golconda mines. The Morning mine, the largest producer of zinc in the State, was closed from June 25 to September 21, and the Star mine, a large producer of zinc and lead, was closed in July. The output of the Morning mine comprised 262,329 tons of zinc-lead-silver ore concentrated by flotation (compared with 350,609 tons in 1937) and 621 tons of first-class lead-silver ore smelted. The 800-ton flotation plant at the Star mine treated 42,015 tons of zinc-lead ore from the Star mine and 85,241 tons of zinc-lead ore from the Hecla mine. Lessees operated the Gold Hunter mine throughout the year and treated about 34,000 tons of lead-silver ore in the 500-ton flotation plant owned by Gold Hunter Mines, Inc. The 250-ton flotation plant at the Golconda mine was used to treat zinc-lead ore (about 3,900 tons) from the Golconda mine and old tailings (7,570 tons), containing chiefly zinc and lead, deposited on various properties by canyon streams.

*Lelande district* (*Burke, Mace, Frisco*).—The value of the metal output of the Lelande district declined 30 percent in 1938. The Hecla mine was, as usual, the largest producer of silver and lead in the district, although its output of ore decreased from 250,630 tons in 1937 to 231,848 tons in 1938. The 750-ton concentration plant at the mine was closed during the summer, and extensive alterations were made to convert the plant to a straight flotation mill; during the reconstruction period zinc-lead ore from the Hecla mine was treated in the Star mill. The output of the mine comprised 133,324 tons of lead ore concentrated, 85,241 tons of zinc-lead ore concentrated, and 13,283 tons of first-class lead-silver ore smelted. The Frisco property was operated throughout the year by the Hull Leasing Co.; it was the largest producer of zinc in the district. The company treated 26,500 tons of zinc-lead ore in a 100-ton flotation plant. The Sherman Lead Co., a large producer of lead-silver ore in 1937, suspended operations in June 1938, resulting in a substantial decrease in the yield of lead and silver. The remainder of the district output was largely old tailings (4,008 tons), containing chiefly zinc and lead, concentrated at the Golconda mill.

*Placer Center district.*—There were large decreases in output of zinc and lead in the Placer Center district in 1938 owing to curtailment of operations at the Tamarack mine. While the mine was operated (January to May and November and December), 7,300 tons of zinc-lead ore were treated in the Hercules custom mill. Nearly all the remainder of the district output was lead-silver ore (7,007 tons) from the Dayrock property, concentrated in the Hercules mill; the property was operated throughout the year by the Dayrock Mining Co.

*Summit district* (*Murray*).—The value of the metal output of the Summit district increased from $19,679 in 1937 to $56,736 in 1938, owing chiefly to the increase in output of gold ore from the Idaho Mother Lode and Golden Chest mines. The ore from both properties (about 5,900 tons) was treated in the 100-ton flotation plant owned

Digitized by Google

by Idaho Mother Lode Gold Mines, Inc. The Golden Chest mine was operated by Consolidated Gold Mines, Inc. The remainder of the district output was chiefly placer gold produced by Nugget Gulch Placers.

*Yreka district (Kellogg).*—The value of the metal output of the Yreka district decreased 34 percent in 1938. The Bunker Hill & Sullivan Mining & Concentrating Co. was, as usual, the most important mining enterprise in Idaho; it ranked first in output of lead, second in silver, and third in zinc. Operations were continuous throughout 1938 at both the Bunker Hill & Sullivan and Crescent properties, but production declined considerably—zinc-lead ore from the Bunker Hill & Sullivan mine from 388,588 tons in 1937 to 347,315 tons in 1938 and silver ore from the Crescent mine from 30,535 to 26,267 tons. There were marked decreases in silver output from the Crescent mine and in zinc and lead from the Bunker Hill & Sullivan mine. The company reported 10,238 feet of development at the two properties in 1938. The Federal Mining & Smelting Co. operated throughout the year at the Page and Blackhawk mines; zinc-lead ore (71,508 tons from the Page and 11,387 tons from the Blackhawk) was treated in the flotation plant at the Page mine. The capacity of the mill was increased to 450 tons a day. Other producers in the Yreka district in 1938 included the Caledonia, Sidney, and Sierra Nevada mines.

### TWIN FALLS COUNTY

The entire output of Twin Falls County in 1938 was placer gold and silver recovered by various operators along the banks of Snake River near Twin Falls, Kimberly, and Hansen.

### VALLEY COUNTY

*Deadwood Basin district.*—Nearly all the output of the Deadwood Basin district in 1938 was lead-silver ore from the Lost Pilgrim mine and gold ore from the W. J. L. claim. The Lost Pilgrim mine had been idle since 1932.

*Pistol Creek district.*—The Lucky Boy mine near Landmark was the only producer in the Pistol Creek district in 1938; 348 tons of lead ore rich in gold and silver were shipped to a smelter in Utah.

*Thunder Mountain district.*—Most of the output from the Thunder Mountain district in 1938 was gold ore from the Sunnyside mine operated by the Thunder Mountain Mining & Milling Co.; about 3,600 tons of gold ore were treated by amalgamation and concentration.

*Yellow Pine district.*—The Meadow Creek property near Stibnite was operated by the Yellow Pine Co. until August 1, 1938, and the remainder of the year by the Bradley Mining Co.; all assets of the Yellow Pine Co. were acquired by the Bradley Mining Co. the first of August. The 200-ton flotation mill was operated throughout the year on ore containing chiefly gold, antimony, and silver, but production of gold and silver was much less than in 1937.

### WASHINGTON COUNTY

The output from mines in Washington County in 1938 was virtually the same as in 1937, as shipments of silver ore containing lead and copper were maintained from the Silver Still property near Mineral.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN MONTANA

(MINE REPORT)

By T. H. Miller and Paul Luff

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 359 | Metallurgic industry | 365 |
| Calculation of value of metal production | 359 | Review by counties and districts | 370 |
| Mine production by counties | 363 | Butte or Summit Valley district | 385 |
| Mining industry | 364 | | |
| Ore classification | 365 | | |

The value of the metal output from mines in Montana decreased 52 percent in 1938 compared with 1937, owing to curtailment in output of copper ore and zinc-lead ore and to lower average prices of silver, copper, lead, and zinc. The output of gold increased slightly, because of regular operations at cyanidation mills, but the output of silver, copper, lead, and zinc decreased markedly. The Anaconda Copper Mining Co. operated the copper mines at Butte at a greatly reduced rate in 1938, and the zinc mines of the company were virtually nonproductive. The output of base ores in Silver Bow, Granite, Jefferson, and Sanders Counties decreased, but the output of gold ore in several counties increased substantially.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

*Gold and silver produced at placer mines in Montana, 1934–38, in fine ounces, in terms of recovered metals*

| Year | Sluicing and hydraulic | | Dry-land dredges [1] | | Floating dredges | | Total | |
|---|---|---|---|---|---|---|---|---|
| | Gold | Silver | Gold | Silver | Gold | Silver | Gold | Silver |
| 1934 | 5,607.71 | 686 | 4,877.79 | 889 | 15,058.39 | 1,562 | 25,543.89 | 3,137 |
| 1935 | 4,586.48 | 647 | 9,031.88 | 1,554 | 12,680.87 | 1,294 | 26,299.23 | 3,495 |
| 1936 | 2,803.02 | 338 | 18,312.43 | 3,393 | 19,300.35 | 1,923 | 40,415.80 | 5,654 |
| 1937 | 2,989.00 | 369 | 15,844.00 | 4,249 | 17,564.00 | 1,797 | 36,397.00 | 6,415 |
| 1938 | 3,896.00 | 351 | 10,096.00 | 2,943 | 21,356.00 | 3,240 | 35,348.00 | 6,534 |

[1] Dragline and power-shovel excavators with sluices or special amalgamators.

*Gold.*—The output of gold in Montana in 1938 increased 1,061 ounces over 1937 (gold from lode mines increasing 2,110 ounces but gold from placer mines decreasing 1,049 ounces). Gold production in Madison County increased 19,395 ounces, owing chiefly to increased output of gold ore at the West Mayflower, Revenue, and Victoria mines. Gold output from Beaverhead and Broadwater Counties also increased, but large decreases were noted in Granite, Silver Bow, Park, Phillips, Jefferson, Deer Lodge, Powell, and Lewis and Clark Counties. There was a marked increase in yield of gold from the Butte Highlands property southeast of Butte, but this gain was more than offset by decreases in gold from both the copper and zinc mines at Butte. Large decreases also in gold output were reported at the Jardine mine in Park County, the Ruby Gulch and Little Ben mines in Phillips County, and the Spring Hill mine near Helena. Several new placer operations were started during 1938, including the new Yuba dredges of Winston Bros. on Prickly Pear Creek and Perry-

Digitized by Google

Schroeder Mining Co. on Hauser Lake and the dragline and washer plants of Ralph E. Davis Syndicate on Grasshopper Creek, Kit Carson Placers on Lowland Creek, and Norman Rogers Mining Co. on Elk Creek; but gains from these plants were more than offset by losses due to suspension of operations on Clancey Creek by the Humphreys Gold Corporation. The lead smelter at East Helena was closed for more than 3 months during the summer, and the copper plant at Anaconda was closed to shippers of siliceous ores during part of the year. As a result, many shippers of siliceous ores and concentrates were forced to suspend operations during part of 1938, and the gold output

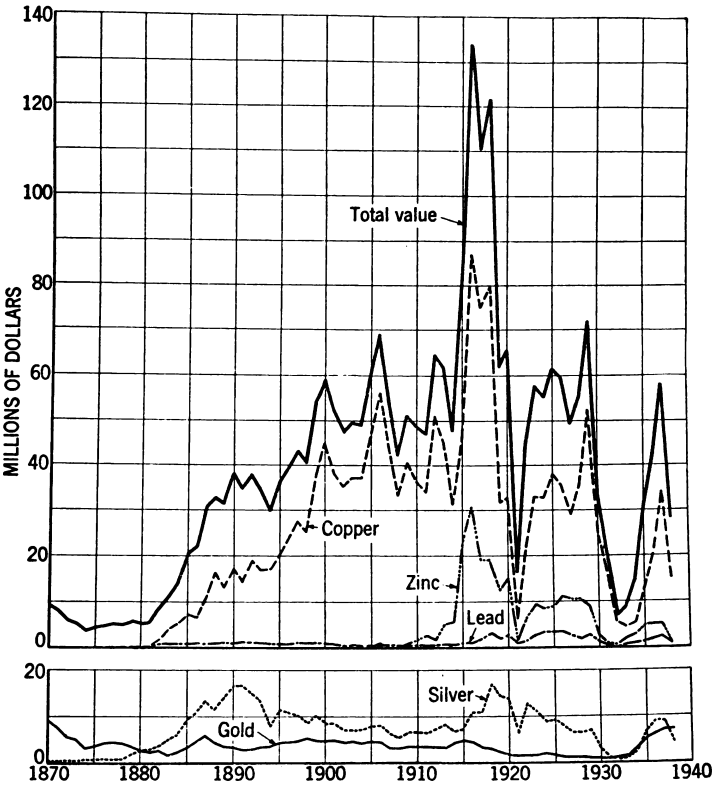

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Montana, 1870–1938.

in many mining districts decreased. The output of gold ore, which yielded 75 percent of the State gold, increased from 644,596 tons in 1937 to 756,223 tons in 1938; the 1938 output comprised 433,233 tons treated at cyanidation plants (310,979 tons in 1937), 77,478 tons treated at amalgamation plants, 190,709 tons treated at concentration plants, and 54,803 tons shipped crude to smelters. The West Mayflower mine in the Renova district, Madison County, was the largest producer of gold in Montana in 1938; other large producers were the Ruby Gulch mine at Zortman, Porter Bros. dredge at Helena, the Butte Highlands mine southeast of Butte, and the Golden Messenger mine at York.

Digitized by Google

*Silver.*—The output of silver in Montana in 1938 decreased 46 percent in quantity and 55 percent in value from 1937, owing chiefly to suspension of mining of zinc-lead ores and curtailment in mining of copper ores at Butte by the Anaconda Copper Mining Co. Silver from Silver Bow County decreased 4,053,327 ounces. The zinc concentrator at Anaconda was closed nearly all the year, causing a marked decrease in silver from custom shippers to the mill from mines near Philipsburg in Granite County (silver from Granite County decreased 1,013,138 ounces). Silver from the Flathead mine of the Anaconda Copper Mining Co. was slightly less than in 1937. There were decreases in silver output in Jefferson and Lewis and Clark Counties, but increases were reported from Cascade and Madison Counties. Copper ore yielded 60 percent of the State total silver, silver ore 23 percent, zinc-lead ore 7 percent, and gold ore 6 percent. Nearly 74 percent of the total silver came from ore concentrated and 24 percent from crude ore shipped for smelting. The output of silver ore decreased from 246,325 tons in 1937 to 150,930 tons in 1938. In addition to the copper mines at Butte and the Flathead mine (all operated by the Anaconda Copper Mining Co.), the Comet mine near Basin, the Trout, Granite Bimetallic, Two Percent, and Silver Prince mines near Philipsburg, and the Big Seven and Florence mines near Neihart were important silver producers.

*Copper.*—The output of recoverable copper in Montana in 1938 decreased 47 percent in quantity and 57 percent in value from 1937. The Anaconda Copper Mining Co. was, as usual, the only important copper producer in the State; its mines at Butte, however, were operated at a greatly reduced rate during 1938, and the quantity of copper ore sent to the mill at Anaconda decreased from 3,068,665 to 1,561,186 tons. The sand-leaching plant at Anaconda was not operated in 1938 (in 1937 it treated 307,014 tons of old tailings by a combination of leaching and flotation concentration). Copper from mine-water precipitates also decreased.

*Lead and zinc.*—Marked decreases were recorded in output of recoverable lead and zinc in Montana in 1938 compared with 1937; lead decreased 48 percent in quantity and 60 percent in value, and zinc 77 percent in quantity and 83 percent in value. Most of the decrease in both metals can be ascribed to reduced activity in the Butte district, normally the chief producing area. The zinc mines of the Anaconda Copper Mining Co. were closed throughout the year, except for development that produced a limited quantity of zinc-lead ore, and the Emma mine was productive in January only; as a result, the output of zinc-lead ore from Silver Bow County dropped to 9,894 tons in 1938. The zinc concentrator at Anaconda was closed most of the year, and custom receipts from mines near Philipsburg declined to 50,023 tons. Decreases in production of zinc-lead ore were reported also from the Comet mine near Basin and the Jack Waite mine in Sanders County. The Jack Waite, Comet, and Flathead mines were the chief lead producers in Montana in 1938, yielding 73 percent of the State total. Nearly 69 percent of the State total zinc in 1938 came from the slag-fuming plant of the Anaconda Copper Mining Co. at East Helena; the plant was closed during the summer and fall, and the output of both zinc and lead decreased markedly.

## MINING INDUSTRY

The output of both copper ore and zinc-lead ore decreased markedly in 1938 compared with 1937, causing sharp declines in output of silver, copper, lead, and zinc, but the output of gold ore continued to increase. Gold recovered from gold ore increased 21,534 ounces and more than offset the decrease of 14,939 ounces in gold from base ores. Nearly all the increase in output of gold ore was made at mines that recently have been equipped with new or rebuilt cyanidation mills; gold ore treated by cyanidation increased from 310,979 to 433,233 tons. Despite the large decrease in output of base ores from Butte the output of gold in Montana increased slightly in 1938, owing chiefly to regular operations at cyanidation mills.

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[2] Includes 5,563,800 pounds recovered from precipitates.
[3] Current slag fumed.
[4] Includes 9,614,024 pounds recovered from precipitates.

## METALLURGIC INDUSTRY

Lode mines in Montana produced 2,724,466 tons of ore and old tailings in 1938 compared with 4,898,009 tons in 1937. The 1938 output comprised 77,478 tons treated at amalgamation mills, 433,233 tons treated at cyanidation mills, 1,976,828 tons treated at concentration mills, 160,118 tons shipped crude to smelters, and 76,809 tons treated at a slag-fuming plant.

Twenty straight cyanidation mills operated in Montana in 1938 and treated 433,233 tons of ore and old tailings, an increase from 310,979 tons in 1937. Twelve of these plants treated 392,307 tons of material containing 67,570 ounces of gold and 198,834 ounces of silver and produced bullion yielding 59,443 ounces of gold and 114,340 ounces of silver, indicating cyanide extractions of 88 percent of the gold and 58 percent of the silver; the 12 plants used 196,866 pounds of 91-percent grade sodium cyanide, 70,038 pounds of zinc dust, and 3,581,351 pounds of lime. Three of them reported the consumption of 1,160 pounds of lead acetate.

Ore treated at concentration mills decreased from 4,167,560 tons in 1937 to 1,976,828 tons in 1938. The 1938 total comprised 190,709 tons of gold ore, 109,546 tons of silver ore, 1,561,804 tons of copper ore, and 114,769 tons of zinc-lead ore.

Details of the treatment of all ores produced in Montana in 1938 are given in the tables that follow.

[1] Includes 15 districts, each having production valued at less than $200.

Digitized by Google

In the following review by counties and mining districts, only the more important operations are mentioned. Many small producing mines and districts whose output is included in the foregoing tables are omitted.

### BEAVERHEAD COUNTY

Ermont Mines, Inc., continued regular operations in 1938 at the Ermont group of 34 claims in the Montana or Argenta district and was again the chief producer in Beaverhead County; 31,583 tons of ore were treated in the 100-ton cyanidation mill, but the output of gold decreased slightly. The remainder of the district output was crude ore shipped for smelting, including gold ore from the Goldfinch, Ground Hog, Humboldt, and Shafer mines; lead ore from the Iron Mountain, Katherine L., Midnight, Silver Horn, and Blue Moon mines; and silver ore from the Silver Horn and Trout Creek properties.

The value of the metal output from the Bannack district increased from $18,160 in 1937 to $132,430 in 1938, both placers and lode mines contributing to the gain. The Golden Leaf (Sleeping Princess) group of 21 mining claims and the 150-ton cyanidation mill at Bannack (owned by the New York Montana Mines Co.) were operated by the I. B. H. Co. during January and February, and 3,222 tons of ore were milled; later the property was acquired by the Golden Messenger Corporation, and nearly 6,000 tons of ore were cyanided during the last quarter of the year; and, in addition, lessees shipped nearly 700 tons of gold ore for smelting, chiefly from the Priscilla and Wallace claims. The Hendricks (Bannack Apex Mining Co.) and the Gold Crown (Taylor, Nelson & Knapp, Inc.) lode mines also were productive. A group of 14 placer claims on Grasshopper Creek (site of the earliest dredging operations in Montana) were acquired during 1938 by the Ralph E. Davis Syndicate; a dragline and dry-land washer were installed, and 338,372 cubic yards of gravel were treated during the season (June 24 to November 20); nearly 1,500 ounces of gold were produced—by far the most important placer production in Beaverhead County. Other producing lode mines in Beaverhead County included the Hecla mine in the Bryant district (2,654 tons of silver ore and lead ore shipped for smelting) and the Quartz Hill property in the Vipond district (699 tons of silver ore shipped for smelting).

### BROADWATER COUNTY

The placer output from the Backer district increased sharply in 1938 owing to the operation of two new dragline dredges in Confederate Gulch—Charles L. Sheridan installed power shovels and a stationary washing plant at the Boulder Bar group and treated about 125,000 cubic yards of gravel, between May 10 and November 12; and A. W. Mylroie (Fairplay Placers, Inc.) operated a dragline and washer, testing ground in Confederate Gulch, and installed heavier equipment early in 1939. The Sheriff placer at the head of Magpie Gulch also was active. Most of the lode production from the district came from the Superior mine; other producing lode mines included the Anna May, Cooper, and Satellite properties.

Gold from lode mines in the Beaver district in 1938 was more than double that in 1937; much of the gain was from the Custer mine near Winston, where the new 60-ton flotation plant was operated regu-

Digitized by Google

larly; the mine produced 1,011 ounces of gold—nearly half of the district total. The remainder of the district output was crude ore shipped for smelting and comprised gold ore from the Agua Fria, Black Tail, Edna, Homestead, Iron Age, Sullivan, Vosburg, and Emma mines and lead ore from the Martha Washington and Stray Horse mines.

Most of the output from the Cedar Plains district came in 1938, as usual, from the Keating property operated by the C-G Gold Corporation; the mine and 100-ton flotation plant were operated regularly and the output of gold increased nearly 30 percent. The Ohio-Keating property was leased by Walter McLaren during the year, and several thousand tons of gold ore were treated in the 50-ton concentrator at the mine. The remainder of the district output included gold ore shipped for smelting from the Barnato, Black Friday, Donald Dee, Gold Coin, Hard Cash, Iron Age, Keystone, Laura Rae, and North Home mines; silver ore from the Spar property; and lead ore from the Gopher mine.

In 1938 the Marietta mine again was the chief producer in the Park district; the output comprised 266 tons of gold ore and 117 tons of lead ore shipped for smelting. Several hundred tons of ore from the Speculator mine were treated by amalgamation, and ore from the Gold Bug mine was treated by amalgamation and concentration; the remainder of the district lode output was crude ore shipped for smelting and included gold ore from the Blacksmith, Crosscut, Little Joe, Mississippi, and St. Louis mines and lead ore from the Iron Mask, Little Fannie, Park-New Era, Silver Mountain, Springhill, W. A. Clark, and West Park mines. Most of the placer output from the district came from the Wilson property on Indian Creek, operated by S. E. E., Inc.

### CASCADE COUNTY

The value of the metal output from Cascade County increased slightly in 1938 despite closing of the lead smelter at East Helena during the summer and fall; several properties suspended operations during the smelter shut-down, and others were forced to ship to lead smelters near Kellogg, Idaho, and Salt Lake City, Utah. All the output of the county came from mines near Neihart in the Montana district. The Montana Silver Queen Mining Co. again was the chief producer in the district; according to the company printed annual report, 13,494 tons of silver ore from the Big Seven group were mined and treated in the 50-ton flotation plant, and 501 tons of rich silver concentrates containing considerable gold and lead were shipped for smelting. The Florence Co. treated 10,108 tons of silver ore from the Florence mine in the 40-ton flotation plant, and Ruby Silver Mines, Inc., milled 5,125 tons of silver ore from the Benton group in a 35-ton flotation plant; silver ore from the Hartley and Silver Belt mines was also milled. The remainder of the output from the Montana district was crude ore shipped for smelting from the Commonwealth, Graham & Hollowbush, and Lucky Strike mines.

### DEER LODGE COUNTY

The value of the metal output from the Georgetown district declined 27 percent in 1938, as all the important producers reported decreases. As usual, the chief producer was the Holdfast group

Digitized by Google

operated by Thomas H. Sheridan; 15,400 tons of gold ore were treated in the cyanidation mill, but gold from cyanide precipitates decreased. The Gold Coin Mines Co. treated several hundred tons of gold ore from the Gold Coin mine by amalgamation and several thousand tons of old tailings by cyanidation; the combined output of gold was less than in 1937. The remainder of the district output was gold ore shipped for smelting from the Isabelle and Southern Cross mines. Other production from lode mines in Deer Lodge County comprised siliceous ore shipped for smelting from the Cashier, Champion, and Independence mines in the Oro Fino district and the Cameron and Silver Heart mines in the Silver Lake district; the output of silver ore from the Silver Lake district decreased sharply, as the Silver Reef mine, an important shipper in 1937, was idle.

### FERGUS COUNTY

The value of the metal output from Fergus County in 1938 increased 35 percent over 1937, owing to regular operation of the enlarged cyanidation mill at the Barnes-King property in the North Moccasin district; the mine was operated the entire year by the North Moccasin Mines Syndicate, and the output of gold increased 1,062 ounces. A test lot of gold ore from the Dawes & Golden mine, also in the North Moccasin district, was treated by cyanidation. The remainder of the county output comprised lead ore from the Iron Chancellor mine in the Cone Butte district; silver ore from the Argentite, Silver Bell, and Silver Queen mines in the Warm Springs district; and placer gold from the Alpine and Grubstake properties in the Warm Springs district.

### FLATHEAD COUNTY

The decrease of $49,607 in the value of the metal output from Flathead County in 1938 was due almost entirely to the lower silver price prevailing, as the output of lead increased 812,000 pounds and that of silver (521,532 ounces) was only slightly less than in 1937. The Flathead mine of the Anaconda Copper Mining Co. in the Hog Heaven district was, as usual, the chief producer; the ouput comprised 15,797 tons of silver ore shipped to the Washoe smelter and 4,997 tons of silver-lead ore shipped to the lead smelter at East Helena. The remainder of the county output was silver ore from the Black Jack and Eudora mines.

### GRANITE COUNTY

The value of the metal output from Granite County declined from $2,634,839 in 1937 to $778,434 in 1938, owing chiefly to suspension of mining of zinc-lead ore at properties near Philipsburg. The Trout Mining Division of American Machine & Metals, Inc., operated the zinc-sulfide unit (Trout and Algonquin mines) during January only and produced 3,320 tons of zinc-lead ore compared with nearly 60,000 tons in 1937; the zinc-lead ore was shipped to the custom mill at Anaconda, and in addition the company shipped 7,481 tons of silver ore for smelting. The Silver Prince property of the Contact Mines Corporation was idle during July and August and operated at a reduced rate during the other 10 months of the year; the output was about one-third of that in 1937 and comprised

159434—39——25

Digitized by Google

3,271 tons of crude ore shipped for smelting and 1,260 tons of zinc-lead ore sent to the zinc mill at Anaconda. The Two Percent mine was operated 10 months by Taylor, Nelson & Knapp, Inc.; the output was about one-half of that in 1937 and comprised 6,732 tons of silver ore shipped for smelting and 443 tons of zinc-lead ore sent to the mill at Anaconda. The Philipsburg Mining Co. operated the Granite Bimetallic mine for 10 months and treated 43,471 tons of ore in the 165-ton flotation plant; however, the 1938 output of silver was less than half of that in 1937, owing to suspension of shipments of old tailings.

Lessees continued shipments of crude ore in 1938 for smelting from properties in the First Chance or Garnet district, but the output of gold from the district decreased 929 ounces. Most of the output again came from various claims of the Mitchell-Mussigbrod group. Other producing lode mines included the Climax, Ella May, Gold Leaf, Grant & Hartford, Lady Jane, Laddy Buck, Lynx, Nancy Hanks, Peggy Ann, Pearl, Sierra, T. H., and Tiger mines.

Operations were continued during 1938 at the Hidden Lake property in the Red Lion district; the company (Hidden Lake Venture, Inc.) treated 24,139 tons of ore in the 70-ton cyanidation mill, but the output of gold declined slightly. A car of gold ore was shipped for smelting from the Olympic mine.

Other producing lode mines in Granite County in 1938 included the Blue Bird, Brooklyn, Gold Reef, Sunday, and Tussle properties in the Boulder district; the Black Pine and Sunrise mines in the Henderson district; the Goldonna (Londonderry) and Gold Coin mines near Maxville; and the Nellie and Stevens mines in the Stony district.

Most of the placer output from Granite County in 1938 came from the Montana-Tonopah placer in the Boulder district, the Tibbits & Fowler placer on upper Gold Creek, and the New Deal placer in Henderson Gulch.

### JEFFERSON COUNTY

The value of the metal output from Jefferson County decreased 31 percent in 1938, owing chiefly to suspension of operation at the Comet property in the Cataract district. The mine and 150-ton flotation plant operated by the Basin Montana Tunnel Co. were idle during the summer, and the output of zinc-lead ore declined from 65,137 tons in 1937 to 38,170 tons in 1938; lead concentrates and iron concentrates were shipped to East Helena for smelting, and zinc concentrates were sent to the electrolytic plant at Great Falls. The Crystal mine, also in the Cataract district, was operated the entire year by Chester Bullock; the output comprised 1,869 tons of gold-silver ore shipped for smelting and 162 tons of zinc-lead ore shipped to a custom mill at Midvale, Utah. Gold ore from the Gray Lead mine was treated in a small concentrator, and the remainder of the lode output from the district was crude ore shipped for smelting from several properties, including the Boulder, Buckeye & Boston, Bullion, Idler, Jib, Minneapolis, Morning Glory, Rose, Saturday Night, Sirius, Vera, Vindicator, and Virginia mines.

There was a marked decrease in output of placer gold from the Clancey (Prickly Pear Creek, Montana City) district in 1938, owing entirely to suspension of operations on Clancey Creek by the Hum-

Digitized by Google

phreys Gold Corporation. The company was the largest dragline operator in Montana in 1937, but operations were discontinued November 27, 1937, and the plant was dismantled. This loss was offset in part by a substantial increase in gold production by Winston Bros. Co., which operated the dragline and floating washer 11 months (the plant was idle in February) in 1938 and treated 820,424 cubic yards of gravel; in addition, the company completed erection of a Yuba connected-bucket dredge on Prickly Pear Creek south of Clancey. The new dredge is electrically powered, the digging ladder is equipped with eighty-eight 6-cubic foot buckets, and gold recovery is effected entirely by Pan-American jigs; the new plant was placed in operation August 20, 1938, and treated 587,653 cubic yards of gravel before the end of the year. Nearly all the remainder of the district output came from a dragline and washer on Dutton Ranch, which treated 43,270 cubic yards of gravel from May 25 to December 24.

The Alta property near Wickes in the Colorado district was operated in 1938 from June to December by Eathorne & Fox; the output comprised 23,748 tons of old tailings treated in a 200-ton flotation plant and 40 tons of lead ore shipped for smelting. The remainder of the district output was crude ore shipped for smelting from the Arogon, Blizzard, Blue Bird, Minah, and Minnesota mines.

The value of the metal output from the Elkhorn district decreased $84,438 in 1938 owing to suspension of operations by Elkhorn Metals, Inc. The company stopped operations at the flotation plant treating old tailings from the Elkhorn property late in 1937, and the output in 1938 was mostly clean-up material from previous operations. The J. L. Shiely Co. acquired the Peacock & Moreau property and treated about 8,000 tons of old tailings by cyanidation. Other producers in the district included the C & D, Golden Curry, Golden Moss, Klondyke, Little Goldie, Sophia, and Wildcat properties.

The placer output from the Lowland district increased markedly in 1938 owing to operation of a dragline and washing plant on Lowland Creek by Kit Carson Placers.

The Newburg Mining & Milling Co. continued operations at the Fleming property in 1938; gold ore was treated by flotation, and nearly 1,500 tons of concentrates were shipped for smelting. In addition, 316 tons of crude gold ore were produced.

Mines in the Whitehall district produced in 1938 at about the same rate as in 1937. As usual, the Golden Sunlight mine, operated by the A. O. Smith Corporation and various sublessees, was the chief producer; about 3,400 tons of gold ore were shipped for smelting. The remainder of the district output comprised gold ore from the Leah, Lucky Hit, Pay Day, Saddle Horse, Sunny Corner, and Sunnyside mines and lead ore from the Mary Lucile and Surprise properties.

The output of gold ore from the Callahan mine in the Wilson Creek (Woodland Park) district was considerably less in 1938 than in 1937. The property was operated by the Golden Age Mining Co.; the ore is treated by amalgamation and flotation.

Other producing lode mines in Jefferson County in 1938 included the Amazon & Deadwood, Bismark, and Golden Point mines in the Amazon district; the State mine in the Bigfoot district; the Ida and 0-25 mines in the Boulder district; the Babe Burns, Columbia, Crystal Hill, and Golden Valley mines in the Homestake (Pipestone) district; the Shaw mine on McClellan Creek; and the Haystack Butte, John & Jim, and Triangle mines in Mitchell Gulch.

Digitized by Google

### JUDITH BASIN COUNTY

Lessees continued operations in 1938 at the property of Glendennin Mines, Inc., in the Barker district; the output comprised 780 tons of silver-lead ore shipped for smelting.

### LEWIS AND CLARK COUNTY

The value of the metal output from Lewis and Clark County in 1938 decreased 33 percent from 1937, owing chiefly to suspension of operations at the slag-fuming plant of the Anaconda Copper Mining Co. at East Helena. The plant, which treats current slag from the lead smelter of the American Smelting & Refining Co., was closed from July 5 to November 3, and the output of zinc-lead fume decreased markedly.

The Golden Messenger Corporation operated the 125-ton cyanidation mill at York (Dry Gulch district) at capacity in 1938, treating about 45,000 tons of ore compared with 35,033 tons in 1937; the output of gold increased 2,908 ounces and accounted for the marked increase in value of the district output. Lessees at the Federal Gold property shipped gold ore for smelting.

The Spring Hill mine near Helena was operated in 1938 by the Montana Consolidated Mines Corporation from January 1 to June 29, when operations were suspended owing to closing of the smelter at East Helena; the 300-ton flotation plant treated 52,414 tons of ore from the Spring Hill mine in 1938 compared with 89,652 tons in 1937, and the output of gold decreased proportionately. At the end of the year a 25-ton cyanidation plant to treat flotation concentrates from the Spring Hill mill was under construction; the new plant was placed in operation early in 1939. The remainder of the output from lode mines in the Helena district was crude ore shipped for smelting from several properties, including the Court House, Eula (Homestake), Jupiter, Lockey, Lone Star, Morelight, San Juan, Sky, Twylight, and Whitlatch mines. Porter Bros. Corporation operated the Yuba dredge (equipped with eighty-five 6-cubic foot buckets) north of Helena the entire year, treating 1,809,812 cubic yards of gravel (about the same amount as in 1937), but the output of gold decreased 12 percent.

Placer production from the Lincoln district decreased in 1938, as the output from the Stonewall placer was much less than in 1937. The Blue Cloud Mining Co. was organized in July to operate a dragline and washer at the Blue Cloud placer; 1,058 cubic yards of gravel were treated during 1938. Other producing placers included the Bloom & Old Billy Williams and Harvey properties; test lots of gold ore were shipped for smelting from the Gold Dollar and Sun Rise lode mines.

The value of the metal output of the Marysville (Ottawa) district increased from $110,205 in 1937 to $211,213 in 1938, owing chiefly to operations at the Empire property by the Rex Mining Co.; gold ore from the mine was treated in a small flotation plant, and lead concentrates, unusually rich in gold, were shipped for smelting. The J. C. Archibald Co. was formed during the year, and from August 1 to October 23 the company treated 10,720 tons of old tailings from the Bald Butte property by cyanidation. Lessees shipped 2,430 tons of

Digitized by Google

gold ore for smelting from the Drumlummon property, and the Bald Butte Lease shipped 961 tons of gold ore from the Bald Butte mine. The remainder of the district lode ouput comprised gold ore shipped for smelting from the Big Ox, Excelsior, Meagher, North Star, Penobscot, Piegan-Gloster, Raymond & Zigmund, and Shannon mines; a little gold ore from the Climax mine, treated by amalgamation; and old tailings from two properties, treated by cyanidation. Most of the district placer output came from a dragline and washer on Silver Creek operated by J. W. Merz; the plant operated from July 11 to September 12 and treated about 40,000 cubic yards of gravel.

The Perry-Schroeder Mining Co. in 1938 completed erection of a new Yuba dredge on Eldorado Bar in the Missouri River (Hauser Lake) district; the dredge, which is equipped with jigs and has a digging ladder equipped with ninety 6-cubic foot buckets, was placed in operation November 27 and treated 75,604 cubic yards of gravel by the end of the year. In addition to gold and silver the dredge also recovers industrial sapphires. Despite operation of the new dredge the value of the placer output from the district decreased owing to closing of the Gruell Bar plant by the Lorraine Placer Mining Co.; other producing placers in 1938 included the Golden Ring & Sunset, Mable, and Ox Bow properties.

The value of the metal output of the Rimini district in 1938 decreased $46,536. Declining prices of lead and zinc caused the closing of the Montana Lead and Little Lily properties at Rimini in August; the output from the Montana Lead property was 303 tons of ore compared with nearly 2,100 tons in 1937; no production was reported at the Little Lily mine, operated by the Callahan Zinc-Lead Co. Other producers at Rimini included the Anna May & Broadway, Aurora, Kelley, and Peerless Jennie mines.

In 1938 the Franklin mine again was the chief producer in the Scratch Gravel district; lessees shipped 323 tons of gold ore from the property, a decrease from 520 tons in 1937. Other producers in the district included the Enakops, Gold Crown, Nettie, and Umatilla mines.

The value of the metal output from the Stemple (Wilborn) district in 1938 decreased 18 percent owing to lessened output from the Gould mine; the mine and 80-ton cyanidation mill were operated the full year by the Standard Silver-Lead Mining Co., and nearly 30,000 tons of gold ore and old tailings were milled, but the output of gold declined nearly 700 ounces and silver nearly 20,000 ounces. Other producers in the district included the American Boy (North Gould Mining Co.), Hubbard, Irma, and Silver Bell mines.

### LIBERTY COUNTY

About 1,000 cubic yards of gravel from the Sweetgrass Placers in the Corral Creek district were treated in a washing plant during 1938; a little placer gold was recovered at the Hatch property also.

### LINCOLN COUNTY

The Gold Hill property in the Cabinet district was operated a short time early in 1938 by the Viking Mining Co., and 1,500 tons of gold ore were treated in a small amalgamation and gravity-concentration plant.

Digitized by Google

The New Deal (Tip Top) mine in the Libby district was operated in 1938 by lessees; several hundred tons of ore was treated by amalgamation and concentration. A car of lead ore was shipped for smelting from the Snowshoe mine 18 miles southeast of Libby. Most of the district placer output came from the power-shovel and sluicing plant of the Liberty Placer Mining Co.; other producing placers included the Nuggett (Stone Mining Co.), Hard Times, and Libby properties.

Several thousand tons of gold ore from the Sylvanite (Keystone) property were treated by amalgamation and flotation in 1938, but the output of gold decreased more than 300 ounces. A little gold ore from the Black Diamond property (Troy Development Association) was treated by amalgamation and concentration, and lead ore from the Lead Cliff mine (mined in 1937) was shipped in 1938 for smelting.

Zinc-lead ore from the Liberty Metals and Blue Creek properties in the Troy district was sent in 1938 to the Hercules custom plant at Wallace, Idaho, for milling.

### MADISON COUNTY

The value of the metal output from lode mines and placers in Madison County in 1938 increased 57 percent. There were increases in the Norris, Pony, Renova, Sheridan, Silver Star, Tidal Wave, and Washington districts; the output from Rochester and Virginia City decreased.

Mines in the Norris district (Upper and Lower Hot Springs and Norwegian) yielded metals valued at $345,291 in 1938, an increase of $99,817 over 1937. Most of the increase was from the Revenue mine in the Upper Hot Springs section, operated by the Revenue Mine Developing Group, Inc. A new 75-ton cyanidation plant at the mine was placed in operation in October and treated 6,400 tons of ore during the remainder of the year; in addition, the company shipped several hundred tons of gold ore for smelting. The Boaz mine, operated by the Boaz Lease, was again the largest producer in the district, it shipped nearly 1,800 tons of rich gold ore for smelting, a slight decrease from 1937. There was a marked increase in gold ore shipped from the Lexington mine, but that from the Josephine mine decreased. Gold ore also was shipped for smelting from the Artic, Betty May, Billy & Helen, Comstock, Eldorado, Elephant's Tail, Emperor, Galena, Grubstake, Golden Treasure, Minnie, Monitor, Montida, Pauline, Pulverizer, Rose Bud, Roy B, and Valdez mines. The floating dredge on Norwegian Creek was operated by Homer Wilson from June 25 to December 31; the output of gold increased more than 400 ounces.

Increases were reported in output in 1938 at both the Mammoth and Atlantic-Pacific properties. The Liberty Montana Mines Co. operated the Mammoth mine the full year and treated 30,862 tons of gold ore in the flotation plant; 1,932 tons of gold-copper concentrates were shipped, and the output of gold increased more than 1,400 ounces. Montana Southern Mining Co. treated 31,820 tons of gold ore from the Atlantic-Pacific mine by flotation and shipped 1,462 tons of gold concentrates for smelting; the mill was idle from July 1 to July 19, but the output of gold from the property increased more than 700 ounces. Lessees operated for 10 months at the Keystone-Strawberry group and treated 750 tons of gold ore by amalgamation

Digitized by Google

and concentration. The remainder of the output from the Pony district comprised gold ore from the Bozeman mine, treated by amalgamation; gold ore shipped for smelting from the Arizona, Ben Harrison Fraction, Chile, Galena, Little King, Lone Wolf, Whip-poor-will, and White Pine mines; and clean-up material from the Boss Tweed & Clipper, Getchell, and Stone mills.

The value of the metal output from the Renova district in 1938 increased $434,570 owing to marked increase in shipments of gold ore by the West Mayflower Mining Co. (Anaconda Copper Mining Co.); the company produced 19,229 tons of rich gold ore, compared with 13,134 tons in 1937, and the mine became the largest producer of gold in Montana. Other producers in the district were the Blue Bird, Colorado, Florence, and Mary Ingabar mines.

The output from the Rochester (Rabbit) district in 1938 was less than half of that in 1937, as shipments of lead ore from the Commonwealth mine were only 124 tons compared with nearly 800 tons in 1937. Other producers included the Half Sole, Delilia, Hidden Treasure, Jack Rabbit, Long Shift, Pasadena, and Shoemaker mines.

The value of the metal output from the Sheridan district in 1938 was more than three times that in 1937 owing to increased shipments of gold ore from the Uncle Sam (Homestake) mine operated by the Sheridan Gold Mining & Milling Co. and the Fairview group operated by Fairview Gold Mines, Inc. Crude ore was shipped also for smelting from the Buckeye, Cousin Jack, Cousin Jennie, Ella Jay, Goldsmith, Jay Bird, Red Bird, Red Pine, Sarge Hall, and Sunbeam mines; in addition, gold ore from the Goldsmith, Red Pine, and Columbia mines was treated in small amalgamation mills.

Victoria Mines, Inc., operated the 100-ton cyanidation plant at the Broadway property throughout 1938 and treated 32,592 tons of ore and old tailings, a marked increase over the 1937 output; in addition, the company shipped 193 tons of gold ore for smelting. There was also a marked increase in gold ore shipped for smelting from the Golden Rod property; the mine was operated the full year by the Golden Rod Mining Co., and more than 1,000 tons of rich gold ore were shipped. The Green Campbell Mining Co. treated several hundred tons of ore in a small cyanidation plant and shipped a car of gold ore for smelting. The remainder of the output from the Silver Star district comprised gold ore shipped for smelting from the Edgerton, Governor Hayes, Jumbo, Moonlight, and Ohio mines.

The value of the metal output from the Tidal Wave district in 1938 increased $32,491 owing to increased shipments of gold ore from the High Ridge mine; the property was operated by a lessee, and 262 tons of rich gold ore were shipped for smelting. Lessees treated 400 tons of ore from the Agitator mine in a small amalgamation and concentration mill, and crude ore was shipped for smelting from the B & H, Carolina, Eagle, Eleanor & Little Goldie, Ella, Granger, Isabella, Keynote, Mountain View, Pollinger, and Smith mines.

The value of the metal output from the Virginia City district in 1938 decreased $173,819. Gold from placer mines decreased from 2,653 ounces in 1937 to 49 ounces in 1938 owing to the closing in June 1937 of the large dragline and washing plant of the Humphreys Gold Corporation. Gold from lode mines also decreased, as the output from the Marietta mine was less than one-sixth of that in 1937, when more than 12,000 tons of ore were milled. Gold ore from the

Digitized by Google

Winnetka mine was treated by amalgamation and concentration. Most of the remainder of the district output was crude ore shipped for smelting from the Alameda, Bamboo Chief, Bartlett, East & West Mapleton, Easton-Pacific, Hansen, High Up, Homestake, Prospect, St. John & Gypsy, Silver Bell, and Winnetka mines.

The Gold Creek Mining Co. completed in 1938 the erection of a floating dredge at the Washington Bar property on Meadow Creek. The new dredge has a digging ladder of seventy-six 4½-cubic foot buckets and handled 284,597 cubic yards of gravel between August 1 and December. Output from lode mines in the Washington district comprised gold ore from the Missouri-McKee mine, treated by amalgamation and concentration, and crude ore shipped for smelting from the Highland Lady, Lehigh, Missouri-McKee, and Twin Lakes mines.

### MEAGHER COUNTY

A ¾-cubic yard dragline and sluicing plant on Thomas Creek was operated in 1938 by the T. C. Mine from June 19 to September 2 and treated 20,870 cubic yards of gravel. A dragline and washer was operated also in Benton Gulch at Watson by W. R. Deem. Other producing placers in the Beaver Creek district included the Bonanza, Eldorado, Sawmill, and Watson properties. A little gold ore was shipped for smelting from the Beverly Hills property in the Little Belt district.

### MINERAL COUNTY

Placer gold output from the Cedar Creek district in 1938 decreased 336 ounces. Fred Byram Placers, Inc., was again the chief producer; the company operated a dragline and washer at the Calumet placer from July 15 to November 14 and treated 9,500 cubic yards of gravel. Other producing placers included the C. B. & Q., Cedar Creek, Dakota, Dr. Eddy & Nugget, McFarland, Meadow Creek, No Name & Blacktail, Ohio Gulch, Oregon Creek, Stemwinder, Stockholm, Sunlight, Swastika, and Windfall properties. A car of gold ore was shipped for smelting from the Last Chance mine near Superior.

### MISSOULA COUNTY

The value of the metal output from the Coloma district in 1938 decreased slightly. The output was gold ore; it included 400 tons from the Mountain View mine, treated by amalgamation and flotation, and crude ore shipped for smelting from the Arm & Hammer, Clemantha, Dandy, Dixie, I. X. L., Mammoth, and Northern Star mines.

The output from placer mines in the Elk Creek district in 1938 increased markedly owing to operation of a dragline and washer by Norman Rogers Mining Co. on Elk Creek 7 miles southeast of Greenough.

The output from the Nine Mile district was placer gold and silver, chiefly from the Boyd, Hard Chance, Oro, and Slide placers.

The value of the metal output of the Wallace district in 1938 decreased $19,635. Copper ore from the Hidden Treasure mine decreased from nearly 1,600 tons in 1937 to 415 tons in 1938.

### PARK COUNTY

The value of the metal output from Park County in 1938 decreased $213,276 owing to idleness at the New Year's Gift mine in the New World district and to the smaller output from the Jardine mine in the

Digitized by Google

Sheepeater district. The Jardine Mining Co. treated about 50,000 tons of ore in the 40-stamp amalgamation and flotation mill, but the output of gold was about 2,400 ounces less than in 1937. Other producing lode mines in the county included the Columbus and Snowshoe mines in the Crevasse district and the Homestake and Republic mines in the New World district. Most of the county placer output came from small-scale operations at the Emigrant and Hefferlin properties in Emigrant Gulch.

### PHILLIPS COUNTY

The two cyanidation mills in Phillips County were operated continuously in 1938; a larger tonnage of ore was treated than in 1937, but the output of gold decreased at each plant. The Ruby Gulch Mining Co. treated 109,925 tons of ore in the 300-ton plant at Zortman and also shipped 602 tons of rich gold ore for smelting, but the output of gold from the property declined 1,320 ounces; development totaled 5,942 feet, and dividends of $55,000 were paid during the year. The Little Ben Mining Co. treated 53,581 tons of gold ore from the August mine in the 100-ton plant compared with 45,209 tons in 1937, but gold in cyanide bullion decreased about 2,400 ounces; development totaled 4,817 feet.

### POWELL COUNTY

The output from placer mines in the Pioneer (Gold Creek) district in 1938 increased slightly. The Pioneer Placer Dredging Co. operated the floating dredge, equipped with seventy-eight 9-cubic foot buckets, on Gold Creek the entire year and treated 1,866,840 cubic yards of gravel from which 6,612 ounces of gold and 761 ounces of silver were recovered, an increase of 308 ounces of gold over 1937. Other producing placers in the district included the Cold Spring, Findasha & Falls, Murray Patent, Nellie B, North Fork, and Yam Hill properties.

The value of the metal output from the Zozell (Emery) district in 1938 decreased $54,493 owing to closing of the Bonanza mine. Lessees shipped 1,366 tons of gold ore from the mine compared with 5,309 tons in 1937, and the output of gold declined 1,330 ounces. Other producing mines in the district included the Argus, Blue Eyed Maggie, Emery, Emma Darling, Hidden Hand, and Sabbath Day properties, all producers of crude ore shipped for smelting.

The Hattie M. & Annie R. property near Elliston (Nigger Hill district) was operated by Newman Bros.; gold ore was treated in a small amalgamation and concentration mill, and 159 tons of gold ore were shipped for smelting. Gold ore from the Big Dick mine also was treated by amalgamation and concentration, and ore was shipped for smelting from the Hi-Ore & Hi-Way, Lilly, Hub Camp, and Ontario mines. Considerable placer gold was produced by the Duclo Mining Co. at a dragline plant in Reinig Gulch.

The placer output from the Washington Gulch district in 1938 decreased markedly owing to the closing in October 1937 of the dragline plant at the Fontana property. The C. A. Wagner Construction Co. installed a dragline and washing plant in Buffalo Gulch and treated 35,967 cubic yards of gravel between September 1 and November 9. Other producing placers in the district included the Beatrice, Cornucopia, Gold Bar, Old Shoe, Rietz, and Whitetail properties. Small lots of rich gold ore were shipped from the Grey (Great States Gold Mining Co.) and Mascotte lode mines.

Digitized by Google

Other producing mines in Powell County in 1938 included the Hill Top and Sweepstake & Sunrise lode mines near Helmville (Big Blackfoot district), the Dark Horse lode mine in the Race Track Creek district, and Harps Placer in Ophir Gulch.

### RAVALLI COUNTY

The Hamilton Victor Reduction Co. operated the 100-ton flotation plant at the Curlew property for 7 months in 1938. Nearly 18,000 tons of old tailings were treated in the mill, and lead concentrates and zinc concentrates were shipped; in addition, the company shipped about 600 tons of gold ore for smelting. Gold ore from the Washington mine in the Overwich district was treated by amalgamation. A test lot of gold ore from the White Cloud mine in the Eight Mile Creek district was shipped for smelting. Most of the placer output from Ravalli County came from the Hogue property in the Overwich district.

### SANDERS COUNTY

The American Smelting & Refining Co. operated the Jack Waite mine in the Eagle district throughout 1938. This property extends over the State line into Shoshone County, Idaho, and production was reported from both States. The output from the Montana section comprised 43,390 tons of ore treated in the flotation plant at Duthie, Idaho, and 1,278 tons of rich lead ore shipped for smelting. Output of all five metals decreased slightly, and lower average sales prices resulted in a marked decrease in total value of the district metal output. The Green Mountain Mining Co. operated the Drake (Dixon) property in the Revais Creek district in 1938 from August until the end of the year; shipments of copper ore totaled 42 tons, a decrease from more than 600 tons in 1937. A little copper ore was shipped from the New Deal mine also. The placer output from the Vermillion district came from the Mammy Lou & Driftwood and Ogoma properties.

### SILVER BOW COUNTY

The following table gives the output of mines in Silver Bow County, which includes the Butte or Summit Valley district, in 1937 and 1938 and the total from 1882 (the first year for which detailed records are available) to the end of 1938.

*Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1937–38, and total, 1882–1938, in terms of recovered metals* [1]

| Year | Mines producing | Ore | Gold (lode and placer) | Silver (lode and placer) | Copper | Lead | Zinc | Total value |
|---|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* | |
| 1937 | 84 | 3,684,972 | 20,521 | 8,071,519 | 287,757,000 | 11,560,000 | 44,066,000 | $45,326,482 |
| 1938 | 55 | 1,642,491 | 15,147 | 4,018,192 | 153,709,857 | 414,978 | 1,883,417 | 18,300,823 |
| 1882–1938 [1] | | [2] | 1,876,183 | 493,902,691 | [3] 5,656,539 | [3] 193,539 | [3] 1,415,905 | 2,305,362,336 |

[1] Grand total, 1882–1937, inclusive, given in Minerals Yearbook, 1938, p. 356, is in error. Total in this table includes corrections. No annual figures have been changed.
[2] Figures not available.
[3] Short tons.

Digitized by Google

*Butte or Summit Valley district.*—The Anaconda Copper Mining Co. operated its copper mines at Butte at a reduced rate throughout 1938, continuing a curtailment that was begun in the last quarter of 1937. Copper ore sent to the copper concentrator at Anaconda decreased from 3,068,665 tons in 1937 to 1,561,186 tons in 1938; the sand-leaching plant at Anaconda was not operated in 1938 (it treated 307,014 tons of old sand tailings in 1937). Copper ore shipped direct to the smelter increased from 35,639 to 45,161 tons, but mine-water precipitates decreased from 6,298 to 4,045 tons. Net copper produced from copper ores decreased 46 percent from 1937, gold 64 percent, and silver 42 percent. Development at all copper claims totaled 112,032 feet compared with 180,181 feet in 1937. The zinc mines of the Anaconda Copper Mining Co. at Butte were closed in the summer of 1937 and were not in production during 1938; limited development (9,614 feet) was continued at the zinc properties, and the output of zinc-lead ore (entirely from development) was only 2,638 tons in 1938, a decrease from 119,536 tons in 1937, resulting in marked decreases in the output of all five metals. The Emma mine (owned by the Butte Copper & Zinc Co. but operated under lease by the Anaconda Copper Mining Co.) was closed January 20, 1938, and only 7,208 tons of zinc-lead ore were produced compared with 107,428 tons in 1937. The zinc concentrator at Anaconda also was closed most of the year, and custom shippers of zinc-lead ore, chiefly those at Philipsburg, were forced to suspend production. The Green Copper property at Butte was operated by a lessee who shipped 618 tons of copper ore to the copper concentrator at Anaconda and 48 tons of zinc-lead ore to the Comet mill near Basin for milling. All the remainder of the district output was crude ore shipped for smelting from the Alice, Amy Silversmith, Anna, Black Rock, Eveline, Fayal, Glengary, Gulch, Hawkeye, Illinois, Josephine, Jumbo, Lavena, Magna Charta, Magnolia, Minnie Jane, Pittsmont, Sailor's Dream, Saukie, and Valdemere mines.

The Butte Highlands Mining Co. operated throughout 1938 at the Highlands (Tilton) group in the Highlands district southeast of Butte. The 75-ton cyanidation mill, placed in operation in November 1937, treated 17,985 tons of ore and old tailings in 1938 (a marked increase from the 2,543 tons treated in 1937), and the output of gold increased from 862 ounces to 8,849 ounces.

The remainder of the output from lode mines in Silver Bow County in 1938 comprised ore shipped for smelting from the Goldflint and Nettie mines in the Independence district and the Blue Bird, O. K., and Way Up mines in the Melrose district.

### TOOLE COUNTY

All the output from Toole County in 1938 came from placers in Eclipse Gulch; about 76,300 cubic yards of gravel were treated by Gold Butte Placers in a dragline and washing plant.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEVADA

**(MINE REPORT)**

By CHARLES WHITE MERRILL AND H. M. GAYLORD [1]

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 387 | Mining industry | 391 |
| Calculation of value of metal production | 387 | Ore classification | 391 |
| Mine production by counties | 390 | Metallurgic industry | 392 |
| | | Review by counties and districts | 398 |

Nevada's mining industry in 1938 was characterized by a halving of the combined value of the output of the base metals—copper, lead, and zinc—compared with 1937. The value of gold production increased slightly and was greater than in any year since 1915; it was the State's most valuable mineral product in 1938. The total value of the gold, silver, copper, lead, and zinc produced in Nevada was $23,529,064 in 1938 compared with $34,617,056 in 1937, a decline of 32 percent. Gold increased 5 percent in both quantity and value. The other metals decreased, as follows: Silver, 10 percent in quantity and 25 percent in value; copper, 38 and 50 percent, respectively; lead, 50 and 61 percent, respectively; and zinc, 37 and 54 percent, respectively. Of the total value of the five metals in 1938, gold accounted for 44 percent, copper 38 percent, silver 12 percent, zinc 4 percent, and lead 2 percent.

During 1938 White Pine County continued to be the largest contributor to the nonferrous metal wealth of the State; it ranked first in output of copper, second in gold, and third in silver. Esmeralda County was the leading producer of the two precious metals and Lincoln County of both zinc and lead.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price for all grades of primary metal sold by producers. [4] $0.64646464.

| Sierra Nevada | Comstock | Storey | 22 | Sierra Nevada, Ltd | Do. |

[1] Gold-silver ore and lead ore also source of small part of the gold.
[2] Production started Mar. 1, 1938.
[3] Approximately three-fourths ore and one-fourth old tailings.

*Silver.*—Of the 10 leading producers of silver in Nevada in 1938 (listed in the following table), only 2 derived their output from straight silver ore; at the other 8 mines silver was a byproduct of gold-silver, zinc-lead, and copper ores. These 10 mines produced 66 percent of the State total.

*Ten leading silver producers in Nevada in 1938, in order of output*

| Mine | District | County | Rank in 1937 | Operator | Source of silver |
|---|---|---|---|---|---|
| Nivloc | Silver Peak | Esmeralda | 5 | Desert Silver, Inc | Silver ore. |
| Mizpah | Tonopah | Nye | 1 | Lessees of The Tonopah Mining Co. of Nevada. | Gold-silver ore. |
| Emma Nevada | Robinson | White Pine | 10 | Consolidated Coppermines Corporation and lessees. | Copper ore.[1] |
| Pioche No. 1 | Pioche | Lincoln | 2 | Combined Metals Reduction Co. | Zinc-lead and lead ores. |
| Tonopah Belmont | Tonopah | Nye | 4 | Tonopah Belmont Development Co., lessees, and sublessees. | Gold-silver ore. |
| Bristol Silver | Jack Rabbit | Lincoln | 12 | Bristol Silver Mines Co | Silver ore. |

| Nevada Standard | Cherry Creek | do | 9 | Nevada Standard Mining Corporation. | Gold-silver ore. |

[1] Gold-silver ore and lead ore also source of small part of the silver.

*Copper.*—Almost 98 percent of the recoverable copper production of Nevada in 1938 came from mines operated by the following companies: Nevada Consolidated Copper Corporation working the Ruth

Digitized by Google

mine at Ruth and the open pit at Copper Flat and the Consolidated Coppermines Corporation working the Emma Nevada mine (all in the Robinson district of White Pine County), and the Mountain City Copper Co. working the Mountain City mine in the Cope district of Elko County. The sharp decrease in total output from 1937, the all-time record year for the State, was the result of a production-curtailment program at the three leading copper-producing properties.

*Lead.*—Two-thirds of the recoverable lead output of Nevada in 1938 was derived from zinc-lead ore mined by the Combined Metals Reduction Co. at the Pioche No. 1 mine in the Pioche district of Lincoln County. The Bristol Silver Mines Co. operating in the Jack Rabbit district of Lincoln County and the Yellow Pine Development Co. in the Yellow Pine district of Clark County recovered much smaller, but substantial, quantities of lead. The outstanding cause of the great decline in the lead production of Nevada in 1938 was suspension of operations at the Tybo mine in the Tybo district of Nye County, upon exhaustion of its known ore bodies late in 1937; the lower average lead price in 1938 was also an adverse factor.

*Zinc.*—Following the closing of the Tybo mine late in 1937, the Pioche No. 1 mine of the Combined Metals Reduction Co. was the only large producer of zinc in Nevada; it was the source of over nine-tenths of the recoverable zinc output of the State in 1938. The only other production of any size came from the property of the Yellow Pine Development Co. in the Yellow Pine district of Clark County.

## MINE PRODUCTION BY COUNTIES

## MINING INDUSTRY

Curtailment of operations at the three large copper mines in Nevada was an outstanding feature of the mining industry in 1938. Production of copper ore decreased 29 percent compared with 1937. Production of ores valued chiefly for lead and zinc declined sharply but comprised a very small part of the total output of the State. There was a slight increase in quantity of dry and siliceous precious-metal material handled, and a smaller proportion of such material consisted of old tailings than in 1937. The installation of a large connected-bucket dredge, the first to operate in Nevada in several years, was a feature of the mining industry in 1938. The quantity of gravel handled at Nevada placers increased.

Getchell Mine, Inc., started production at the Getchell mine in the Potosi district of Humboldt County early in 1938 and was the third largest gold producer in the State during the year. The company was on a dividend-paying basis by the end of 1938. Among the major producers who ceased operations late in 1937 or during 1938 were: Eastern Exploration Co., Goldfield district, Esmeralda County; Arizona Comstock Corporation, Comstock district, Storey County; Buckhorn Mining Co., Buckhorn district, Eureka County; Treadwell Yukon Co., Ltd., Tybo district, Nye County; and Pioche Mines Consolidated, Pioche district, Lincoln County.

### ORE CLASSIFICATION

The following table classifying ores produced in Nevada in 1938 shows that 69 percent of the tonnage of ore (including old tailings) sold or treated was copper ore, 24 percent gold ore, 4 percent gold-silver ore, 2 percent silver ore, and the remaining 1 percent zinc-lead and lead ores.

Details of ore classification are given in the chapter of this volume on Gold and Silver.

## METALLURGIC INDUSTRY

Of the 5,880,021 tons of lode material sold or treated in 1938 in Nevada more than 70 percent was ore sent to concentration mills, 17.5 percent was ore sent to amalgamation and cyanidation mills, 9 percent was old tailings sent to amalgamation and cyanidation mills, 3 percent was ore shipped crude to smelters, and the remainder (less than 0.5 percent) was old tailings shipped to smelters. The principal changes from 1937 were a decrease in proportion of total ore sent to concentration mills and a marked increase in proportion of ore treated at amalgamation and cyanidation mills. In 1938 flotation was employed at concentration mills to the virtual exclusion of gravity concentration; in former years gravity concentration had been used on a larger part of the ore treated. At amalgamation and cyanidation mills much more of the material was treated by cyanidation than by amalgamation; nearly all the old tailings sent to such mills were cyanided. Of the total gold recovered as bullion, cyanidation accounted for 77 percent and amalgamation 23 percent. The quantity of crude ore shipped to smelters declined 37 percent from 1937. There was a very large drop in White Pine County, where decreased output of copper concentrates lessened the need for siliceous ores for fluxing purposes at the McGill smelter. Curtailed operations at the Mountain City copper property in the Cope district of Elko County and exhaustion of its very high grade smelting ore combined to decrease the output of copper ore from that property. The roaster and cyanide plant [2] at the Getchell mine was the outstanding addition to the metallurgical equipment of the State to start operating during 1938.

Custom mills were operated in various parts of the State during 1938; those of importance were at Silver City in Lyon County and at Searchlight, Goodsprings, and Nelson in Clark County. Most of the custom mills derived part of their mill feed from mines worked by the mill operators. Large quantities of ore and concentrates were

[2] Engineering and Mining Journal, vol. 139, No. 8, August 1938, p. 84.

Digitized by Google

shipped out of the State, principally to lead and copper smelters in the Salt Lake Basin. The Bauer (Utah) plant of the Combined Metals Reduction Co. treated all the company zinc-lead ore mined at Pioche, Lincoln County. The McGill copper smelter at McGill, operated by the Nevada Consolidated Copper Corporation, continued in 1938 to be the only smelter and the most important metallurgical plant in the State.

[1] Ore figures include sands, slimes, and concentrates cyanided.
[2] Yielded also 1,300 pounds of copper from "cyanide" precipitates.

### CHURCHILL COUNTY

*Dixie Valley district.*—The Comstock-Keystone Mining Co. treated 1,700 tons of impounded amalgamation tailings in 1938 by cyanide leaching at its Dixie mine between September 1 and the end of the year.

*Fairview district.*—The Nevada Hills mine was worked by Nevada Range Mines, Inc., and lessees in 1938; a substantial quantity of silver and gold was produced. The Reorganized Silver King Divide Mining Co. shipped gold-silver ore from the Road Runner mine to smelters.

*Sand Springs district.*—The treatment of 189 tons of ore from the Dan Tucker and Summit King mines in 1938 yielded 155 ounces of gold and 5,762 ounces of silver; all the ore was shipped, part to a smelter and the remainder to a custom cyanide plant. It is of interest to recall that during the early days of the Comstock Lode salt recovered from a dry lake in the Sand Springs district was transported by camels to the Lode for mills using the Washoe process.

*Wonder district.*—Lessees at the Nevada Wonder mine in 1938 shipped 1,419 tons of smelting ore, which contained 573 ounces of gold and 39,242 ounces of silver. Several other operations, all small, were reported in the Wonder district.

### CLARK COUNTY[3]

*Crescent district.*—During 1938 a lessee of the Paden mine shipped 189 tons of smelting ore which contained 2 ounces of gold, 7,244 ounces of silver, and 4,849 pounds of lead.

*Eldorado Canyon district.*—The El Dorado Rover Mining Co. worked the Flagstaff, Rover, and Skylark groups throughout 1938; the company 100-ton cyanide plant was completely rebuilt, and a large quantity of gold-silver ore was treated. The Diamond Gold Mining Co., which operated the Techatticup mine, enlarged its flotation mill by 30 tons to a daily capacity of 90 tons; the ore yielded a gold-lead concentrate which was shipped to a smelter. The ore mined by W. W. Hartman at the Wall Street mine was treated by amalgamation and flotation; the resulting concentrates were shipped to a smelter.

*Searchlight district.*—Lessees produced a substantial quantity of gold ore at the Blossom mine during the early months of 1938, but litigation suspended operations later in the year. The Duplex mine was worked by lessees throughout 1938; 84 tons of ore contained 151 ounces of gold, 169 ounces of silver, 6,087 pounds of lead, and 1,496 pounds of copper. Lessees shipped ore from the M & M mine to custom cyanide mills and smelters for treatment. In addition to shipping material from a clean-up of the mill, lessees of the Quartette mine shipped a substantial quantity of ore to smelters and custom mills. Other properties in the Searchlight district were operated on a small scale, mostly by lessees.

*Yellow Pine district.*—The Barefoot Lease, operator of the Barefoot and Golden Chariot mines in 1938, treated 1,020 tons of ore from the Barefoot mine by amalgamation and flotation and shipped 1,141 tons of ore and 25 tons of concentrates to smelters; 1,966

[3] *See also* Vanderburg, W. O., Reconnaissance of Mining Districts in Clark County, Nev.: Bureau of Mines Inf. Circ. 6964, 1938, 81 pp.

Digitized by Google

ounces of gold were recovered. A smelter shipment of 59 tons of ore from the Golden Chariot mine contained 154 ounces of gold, 30 ounces of silver, and 2,295 pounds of copper. The Chiquita Mining Co., Ltd., operated the Chiquita mine throughout the year; 21,789 tons of gold ore treated by amalgamation, cyanidation, and gravity concentration contained 8,179 ounces of gold, 526 ounces of silver, 3,298 pounds of copper, and 709 pounds of lead. Lessees of the Root Zinc mine on Bonanza Hill shipped 708 tons of zinc-lead ore, containing 473,334 pounds of zinc and 117,958 pounds of lead, and 21 tons of lead ore, containing 20,177 pounds of lead and 278 ounces of silver. The Yellow Pine Development Co. shipped a substantial quantity of zinc-lead ore.

### ELKO COUNTY

*Centennial district.*—Lead concentrates rich in gold were shipped from the Bull Run mine in 1938.

*Cope district.*—The Mountain City Copper Co. operated its Mountain City mine in 1938 from January 1 to May 31 and from November 1 to December 31. The company was the leading copper producer in Elko County and had the third-largest output of copper in the State. A substantial quantity of high-grade copper ore was shipped for smelting, but the bulk of the output was flotation concentrates from the 400-ton mill. An extensive exploration campaign was reported at the Rio Grande mine by the Rio Grande Copper Co,, subsidiary of the Sunshine Mining Co. of Idaho; no shipments were made.

*Cornucopia district.*—Old tailings containing gold and silver were shipped from the Cornucopia district in 1938.

*Delano district.*—Silver-lead ore was shipped to a smelter from the Net Nos. 1, 2, 3, and 4 by the Delno Mining & Milling Co. during 1938.

*Gold Circle district.*—Gold & Silver Circle Mines, Inc., treated by cyanidation in 1938 25,300 tons of gold-silver ore which yielded 2,303 ounces of gold and 53,631 ounces of silver; in addition, 64 tons of gold ore were shipped to a smelter.

*Island Mountain district.*—Bruneau Gold, Inc., treated 150 tons of ore by amalgamation and flotation during 1938 and recovered 50 ounces of gold and 15 ounces of silver; a 15- to 20-ton pilot stamp and flotation mill was completed on the property.

*Jarbidge district.*—J. W. Williams, lessee of the Alpha mine, treated in 1938, by amalgamation and cyanidation, 642 tons of ore containing 164 ounces of gold and 669 ounces of silver; operation covered the period May 1 to October 11. The same operator treated 410 tons of ore, mined at the Kookaboora claim, which yielded 97 ounces of gold and 140 ounces of silver.

*Lime Mountain district.*—In 1938 Lime Mountain Consolidated shipped to a smelter 5,308 tons of ore which contained 2,458 ounces of gold, 7,368 ounces of silver, and 182,701 pounds of copper; the operation was continuous throughout the year.

*Mardis district.*—Lessees of the Virginia mine in 1938 shipped 42 tons of ore which contained 172 ounces of gold, 145 ounces of silver, and 928 pounds of copper.

Digitized by Google

*Spruce Mountain district.*—Leasing and development work at the property of the Missouri Monarch Consolidated Mines Co. during 1938 resulted in the shipment of 297 tons of lead ore which contained 2 ounces of gold, 6,984 ounces of silver, 128,048 pounds of lead, and 837 pounds of copper. Small shipments were made from several other properties in the Spruce Mountain district.

### ESMERALDA COUNTY

*Desert district.*—In 1938 a lessee of the Homestake No. 1 mine of the Gilbert Homestake Gold Mining Co. shipped 156 tons of gold ore which yielded 223 ounces of gold and 280 ounces of silver; 59 tons of the ore were treated at a custom cyanide plant, and 97 tons were smelted.

*Divide district.*—In 1938 the Tonopah Divide Mining Co. shipped to a smelter 1,133 tons of ore which contained 672 ounces of gold and 23,331 ounces of silver.

*Dyer district.*—In 1938 Molini Bros. operated the Silver King mine, a new strike 14 miles northwest of Dyer post office on the State line; 48 tons of lead ore shipped for smelting contained 1 ounce of gold, 4,731 ounces of silver, 466 pounds of copper, and 5,309 pounds of lead; most of the ore was mined at the surface.

*Goldfield district.*—Lessees shipped a small quantity of high-grade gold ore for smelting from the Combination Fraction during 1938. The Eastern Exploration Co. and other lessees shipped 1,551 tons of ore, containing 2,596 ounces of gold, for smelting from the Florence and Merger claims of the Goldfield Deep Mines Co. of Nevada. Lessees worked the property of the Goldfield Consolidated Mines Co. throughout the year; 5,985 feet of development work were done. The Eastern Exploration Co., largest gold producer in the Goldfield district in 1936 and 1937, suspended operations at Goldfield during 1938. The Bradshaw Syndicate, Inc., most productive lessee on the Goldfield Consolidated property, treated 344,000 tons of old tailings by cyanidation to recover 3,545 ounces of gold and 2,713 ounces of silver between April 6 and December 18; the 1938 season marked the beginning of a program for the re-treatment of 1,600,000 tons of tailings discharged during earlier operations of the company.

*Hornsilver district.*—In 1938 a lessee of the Empress and Gold Bug mines, 40 miles south of Goldfield, shipped to smelter 172 tons of ore which contained 210 ounces of gold, 276 ounces of silver, 183 pounds of copper, and 6,367 pounds of lead. The Ohio Mines Corporation worked the Goldpoint and Tokop (Orleans group) mines throughout the year; the ore was treated by cyanidation in the 50-ton cyanide mill of the company.

*Lone Mountain district.*—The Weepah Nevada Mining Co. exhausted its known ore reserves at the Weepah mine and began during 1938 to re-treat flotation tailings; 81,871 tons of ore and 26,468 tons of old tailings were cyanided to recover 11,253 ounces of gold and 24,211 ounces of silver.

*Silver Peak district.*—A small quantity of high-grade gold ore was shipped to a smelter from the Brodie mine in 1938. Gold ore for smelting was shipped from the Coyote mine also. The Black Mammoth Consolidated Mining Co., operator of the Mary mine, was the

Digitized by Google

largest producer (in terms of gold output, tonnage of ore, and total value of production) in the Silver Peak district; in 1938 the company purchased the Mary mine, which it had formerly operated under lease from the Pittsburg Silver Peak Gold Mining Co. The company operated its 100-ton cyanide mill. A part of the company property was worked independently by the Prescott Lease, which built a 300-ton amalgamation and flotation mill. Desert Silver, Inc., treated 69,678 tons of ore from the Nivloc mine in 1938 at its 175-ton all-slime cyanide mill to recover 2,709 ounces of gold and 768,280 ounces of silver, drove 5,521 feet of development headings, and built a precious-metal refinery; the company was the largest silver producer in the State. The Gold Wedge Divide Mining Co. treated part of its ore by cyanidation and shipped part to a smelter.

### EUREKA COUNTY [4]

*Buckhorn district.*—In 1938 lessees shipped to a smelter from the Ace No. 3 claim 2,792 tons of Buckhorn dump ore which contained 551 ounces of gold and 4,489 ounces of silver.

*Cortez district.*—The Cortez Metals Co. shipped silver ore from its property in 1938 for smelting. The most productive operation in the Cortez district was in the Mill Canyon section, where the property formerly worked by the Roberts Mining & Milling Co. was taken over by Greenan & Co., Inc.

*Diamond district.*—Smelter shipments from the Diamond district in 1938 included silver ore from the Wynona mine and silver-lead ore mined by the Summit Peak Mining Co.

*Eureka district.*—In 1938 the Eureka Prospect Co. shipped to smelters from the Diamond-Excelsior mines 1,374 tons of gold-silver ore containing 355 ounces of gold, 13,010 ounces of silver, 1,348 pounds of copper, and 88,826 pounds of lead; the mine was closed down except for leasing. Cardinalli & Frank (lessees) and sublessees on the property of Eureka Mines, Inc., shipped 310 tons of lead ore for smelting; the ore contained 97 ounces of gold, 6,056 ounces of silver, and 58,528 pounds of lead. The Eureka Corporation, Ltd., worked several properties in the Eureka district and shipped the output to smelters; gold-silver ore was shipped from the Helen, Jackson, and Phoenix mines and gold ore and lead ore from the Richmond-Eureka mine. Gold ore was shipped from the Silver Conner mine and gold-silver old tailings from the Windfall tailings pile. Several smaller producers in the district reported smelter shipments.

*Lynn district.*—A number of placer and lode properties were active in the Lynn district in 1938; however, the output of the most productive, a placer property, was only 55 ounces of gold.

*Safford district.*—A small smelter shipment of silver-lead ore mined during 1938 was made from the Morning Glory property.

### HUMBOLDT COUNTY [5]

*Awakening district.*—The Alabama mine was worked by the Alabama Syndicate, lessee, from March 15 to August 31, 1938. A large quantity of gold ore from the Jumbo mine was treated by amalgamation; the mine was operated between April 1 and December 31.

*Barrett Springs district.*—Gold ore from the King Gold No. 3 was treated by amalgamation in 1938. A development campaign at the Pansy Lee mine by West Coast Mines, Inc., resulted in the production of 189 tons of smelting ore which contained 59 ounces of gold, 4,023 ounces of silver, 208 pounds of copper, and 9,240 pounds of lead; 1,850 feet of development work were done in 1938.

*Central district.*—A number of small shipments of ore and bullion were made from the Central district during 1938.

*Gold Run district.*—Marigold Mines, Inc., was the leading producer among a number of lode and placer operators in the Gold Run district in 1938.

*National district.*—The P. H. O'Neil Corporation worked the National mine in 1938; 161 pounds of high-grade gold ore yielded 199 ounces of gold and 212 ounces of silver by barrel amalgamation, 1 ton of smelting ore contained 64 ounces of gold and 105 ounces of silver, and 939 tons of ore treated by flotation yielded 44 tons of concentrate which contained 157 ounces of gold and 3,321 ounces of silver.

*Potosi district.*—Getchell Mine, Inc., started production at the Getchell mine March 1, 1938, and by the end of the year had established itself as the leading mining enterprise in Humboldt County; the ore was mined in an open pit and delivered to the 600-ton cyanide plant by truck. Oxide ore was treated by slime agitation and sand leaching and sulfide ore by roasting followed by all-slime cyanidation. During the year 4,072 feet of development work were done. On September 21, 1938, the company declared its first dividend.

*Varyville district.*—Columbia Mines, Inc., shipped gold ore in 1938 for smelting from the Gurney Gordon mine.

*Warm Springs district.*—Ore mined at the Ashdown property, near the Nevada-Oregon State line, was treated in 1938 by amalgamation; the mine was operated during the last 3 months of the year.

### LANDER COUNTY [6]

*Battle Mountain district.*—In 1938, as in 1937, lessees at the numerous small mines in the Battle Mountain district produced most of the ore shipped for smelting. The Copper Canyon Mining Co., which operated mines of the Copper Canyon Group and the Copper Basin Group, was the leading producer of the district; part of its property was worked on company account and part through lessees; and, in all, 7,564 tons of copper ore, which contained 2,673 ounces of gold, 13,959 ounces of silver, and 776,881 pounds of copper, were shipped for smelting. The company's development program was discontinued in April, awaiting completion of financing, but curtailed operations, principally stoping, were continued through 1938. Treatment of 500 tons of surface material at the Homestead and Lindy Group yielded 111 ounces of gold and 46 ounces of silver. The Buffalo Valley Mines Co. shipped gold ore for smelting from the Honeycomb Group 17 miles south of Valmy. Lessees on the San Miguel mine shipped 1,429 tons of gold ore which contained 1,075 ounces of gold, 2,684 ounces of silver, 2,665 pounds of copper, and 6,109 pounds of lead. Other active lode mines in the district included the Armour, Bailey Day, Bentley, Big Florence, Big Four Annex, Billie Dog, Black Butte Group, Blue Bird,

[6] *See also* Vanderburg, W. O., Reconnaissance of Mining Districts in Lander County, Nev.: Bureau of Mines, Inf. Circ. 7043, 1939, 83 pp.

Digitized by Google

Buzzard, Gold Butte Group, Gold Cash, Independence, Lucky Strike, Minnie, Morning Star, Snow Storm, and Tomboy. F. C. Madsen recovered 113 ounces of gold by dry washing at the Box Canyon Placers property. Chase & Caldwell took over control and operation of the Dahl Placers mine from the Grand Hills Mining Co. on August 15, 1938; during the year 1,043 ounces of gold and 136 ounces of silver were produced at the property from 6,403 cubic yards of virgin gravel, extracted by drift mining, and 7,000 cubic yards of tailings. Other productive placer properties in the district included the Copper Canyon, Eva B, Guy Davis, Poorman, and Vail.

*Bullion district.*—E. J. Bumsted operated the Goldacres mine throughout 1938; 8,300 tons of ore were crushed to 2-inch mesh and given a 7-day leach in a 2-pound cyanide solution, and 1,572 ounces of gold and 320 ounces of silver were recovered. Production was recorded from the Gold Quartz mine during the year. The Gray Eagle Mining Co. shipped to smelter from the Gray Eagle mine 913 tons of gold-silver ore which contained 254 ounces of gold, 22,431 ounces of silver, 8,056 pounds of copper, and 47,479 pounds of lead. The Mill Gulch Placer Mining Co. operated a washing plant and dragline and was the largest producer of placer gold in the State. A number of lessees using small-scale hand methods on the Independence and the Triplett Group mines produced substantial quantities of placer gold.

*Hilltop district.*—Crude ore was shipped during 1938 for smelting from the Blue Dick, Hilltop, Paymaster, and Pittsburg Red Top mines.

*Kingston district.*—A lessee worked the Kingston mine throughout 1938 and produced 188 tons of gold ore and 100 tons of silver ore containing 42 ounces of gold, 3,185 ounces of silver, and 389 pounds of lead; the gold ore was treated by amalgamation and concentration, and the silver ore and 2 tons of lead concentrate were shipped to a smelter.

*Lewis district.*—Gold & Silver Circle Mines, Inc., worked the Betty O'Neal mine in 1938; part of the mine output was treated by flotation followed by smelting of concentrates and part was shipped for direct smelting. A lessee on the Dean mine shipped to a smelter 57 tons of ore which contained 145 ounces of gold and 756 ounces of silver. The Calgrason Mining Co., operator of the Treasure Vault mine, shipped to smelter 391 tons of ore which contained 197 ounces of gold, 3,664 ounces of silver, and 13,598 pounds of copper.

*Reese River district.*—The Austin Silver Mining Co. worked its group of mines (including the Jack Pot, Camargo, Littrell, Eclipse, and North Star) from January 1 to May 1, 1938; material shipped to a smelter included crude silver ore and silver concentrate from ore treated in the company 120-ton flotation mill. During 1938 four stockholders of the company were awarded a judgment against those financing it; this was the first such award rendered under the financiers' liability clause (sec. 11) of the Securities and Exchange Commission Act of 1933.

### LINCOLN COUNTY

*Comet district.*—Lessees shipped lead ore and dry silver old tailings from the Prince mine in 1938.

*Ferguson district.*—Cyanidation of Delamar tailings by the Caliente Cyanidation Co. was the outstanding activity in the Ferguson district

Digitized by Google

during 1938. Smelter shipments of gold ore by lessees on the Delamar Exploration Co. property were recorded also.

*Jack Rabbit district.*—The Bristol Silver Mines Co., largest producer in the Jack Rabbit district in 1938, shipped a substantial quantity of mine and dump ore to a smelter; the material yielded silver, copper, lead, and gold.

*Pioche district.*—The Combined Metals Reduction Co., operator of the Pioche No. 1 mine, was the leading producer of both zinc and lead in Nevada during 1938; the company was also one of the leading silver producers of the State. A small quantity of lead ore was shipped by the company for direct smelting, but most of the output—argentiferous zinc-lead ore—was shipped to the company 600-ton flotation mill at Bauer, Utah, where gold (iron) concentrate, lead concentrate, and zinc concentrate were made. Pioche Mines Consolidated treated a substantial quantity of dump ore from the Raymond and Ely mines by flotation during the first 3 months of the year.

*Tempiute district.*—Lessees on the Sterling mine of the Tempiute Mining Co. shipped silver ore to a smelter in 1938.

### LYON COUNTY

*Silver City district.*[7]—Lessees shipped ore to custom mills from the Buckeye mine during 1938; some was amalgamated, some was cyanided, and some received both treatments. The Dayton Consolidated Mines Co., operator of the Dayton mine, continued to be the leading producer of both gold and silver in the Silver City district; it operated also the Oest and Kossuth mines in this district, as well as properties in the Comstock district of Storey County. In addition to company ore, a large quantity of custom ore was treated in its cyanide mill. The Dayton Douglas Cyanidation Co. cyanided old tailings in its 100-ton leaching plant at the Douglas tailings dump from April 1 to November 15. Lessees on the Haywood and Montezuma mines shipped ore to custom mills. Ore shipped by lessees on the Silver King mine was cyanided and amalgamated at custom mills. A large quantity of ore from the property of South Comstock Gold Mines, Inc., was treated by amalgamation and flotation; the resulting concentrates were shipped to a smelter. Lessees on the Vivian mine shipped ore to a custom cyanide mill. A lessee on the Wonder Extension mine shipped ore to custom mills.

### MINERAL COUNTY

*East Walker district.*—Several small outputs of gold ore from the East Walker district were recorded in 1938. The Eureka mine was the largest gold producer.

*Fitting district.*—High-grade gold ore was produced at the Western Duke claims during 1938; part of the material was treated by amalgamation and part shipped to a smelter.

*Garfield district.*—The New Eldorado Mines Co. shipped gold-silver ore in 1938 for smelting from the Garfield mine. Lessees shipped gold-silver ore for smelting from the Mabel mine.

[7] *See also* Gianella, Vincent P., Geology of the Silver City District and the Southern Portion of the Comstock Lode, Nev.: Univ. Nevada Bull., vol. 30, No. 9, 1936, 108 pp.

Digitized by Google

*Hawthorne district.*—The Nevada Miners Trust Estate leased the Silent Partner Group to the Borealis Mines Trust Estate June 16, 1938; the lessee shipped 792 tons of gold ore to a custom cyanide mill, where 610 ounces of gold and 1,008 ounces of silver were recovered; construction of a 25-ton cyanide leaching plant was begun at a site 1 mile southwest of Fletcher. Gold ore was shipped to a custom cyanide mill and a smelter from the Ashby Gold Mines Co. property in 1938.

*Rand district.*—The Nevada Rand Mining Co. held a lease and option on the Nevada Rand mine for part of 1938, during which time gold-silver ore was shipped to a smelter and a custom cyanide plant.

*Regent district.*—Gold ore from the Heckla mine was shipped to a smelter and a custom cyanide plant in 1938. Smelter shipments were also made from the Wild West mine.

*Silver Star district.*—A lessee on the Fortuna, Keystone, and Hardscrabble mines in 1938 shipped to custom plants 110 tons of ore which yielded 100 ounces of gold and 74 ounces of silver. Shipments from the Mary Ann mine yielded substantial quantities of gold. Bullion and gold ore were shipped from the Sunset mine.

### NYE COUNTY

*Athens district.*—The Warrior was the only mine in the Athens district from which production in 1938 was reported.

*Bullfrog district.*—The U. S. Milling Corporation worked the Polaris mine during 1938; a 100-ton flotation mill was reported to have been built by the company.

*Manhattan district.*—Lessees on the Jumping Jack Merger property treated 1,200 tons of old tailings by amalgamation in 1938 and recovered 106 ounces of gold and 47 ounces of silver. Ore mined by lessees at the property of the Manhattan Consolidated Mines Development Co. was treated by flotation, and the concentrates were shipped for smelting. Lessees worked the property of the Nevada Coalition Gold Mines Co. Production was recorded from the Sunday No. 2 mine of the Manhattan Gold Mines Co. The Reliance Mining Co., operator of the Verden mine, was the largest producer in the Manhattan district in 1938. Lessees shipped 3,277 tons of gold ore from the White Caps mine; the ore yielded 3,171 ounces of gold and 173 ounces of silver. Gold was reported produced at the Ajax mine, which was worked by small-scale hand methods. The Manhattan Gold Dredging Co. installed an electric dredge, having one hundred and eight 9½-cubic foot buckets, on the Gold Bench and Gold Bench No. 1 claims 4 miles west of Manhattan; dredging started November 15, and 459,792 cubic yards of gravel had been handled by the end of the year. This was the first dredge of the connected-bucket type to operate in Nevada in a number of years. Lessees on the Jack drift placer produced a substantial quantity of gold. Sluicing operations at the Little Grey mine produced a sizable output of gold between April 1 and the end of the year. Between January 3 and May 30, 123 ounces of gold were produced at the Manhattan No. 1 placer property from 840 cubic yards of gravel. Several lessees treated 1,633 cubic yards of gravel from the Orphant drift placer and recovered 190 ounces of gold.

*Millett district.*—Shipments (152 tons) of silver ore from the Grant mine in 1938 contained 23 ounces of gold, 6,064 ounces of silver, and 11,505 pounds of lead; a tramway and ore bins were constructed.

Digitized by Google

*Phonolite district.*—Lessees shipped 228 tons of ore from the Derelick mine to a custom cyanide mill and a smelter during 1938; 126 ounces of gold and 6,074 ounces of silver were recovered. The Penelas Mining Co., second largest producer in Nye County, operated its mine and 50-ton cyanide mill throughout the year.

*Quartz Mountain district.*—A lessee worked the San Rafael mine during 1938.

*Round Mountain district.*—Gold Hill Mines, Inc., worked the Gold Hill mine from June 1 to December 1, 1938; 1,015 tons of ore were treated in the company 100-ton cyanide plant and 74 tons were shipped to a smelter; the total metal yield was 410 ounces of gold and 1,002 ounces of silver. The leading producer in the Round Mountain district in 1938 was the Nevada Porphyry Gold Mines Co., which operated the placer section of its property by hydraulicking from March 22 to August 10 on company account and for the rest of the year through a lessee.

*Tonopah district.*—In 1938, from the first of the year until August 1, the Tonopah Belmont Development Co. leased the Tonopah Belmont mine to the Belmont Lease which operated it through sublessees; during the last 5 months of the year the owner leased directly to the miners. In all, 7,028 tons of gold-silver ore shipped to smelters contained 2,574 ounces of gold, 231,830 ounces of silver, and 22,329 pounds of lead. Miscellaneous lessees at the Tonopah Extension mine shipped 250 tons of smelting gold-silver ore which contained 51 ounces of gold and 5,700 ounces of silver. Several sets of lessees produced the entire output of the property of the Tonopah Mining Co. of Nevada in 1938. Ore from the West End mine was shipped by lessees.

*Tybo district.*—In 1938, from November 1 to the end of the year, lessees shipped to a smelter 1,302 tons of ore containing 212 ounces of gold and 30,988 ounces of silver; the ore was derived largely from old dumps at the Tybo property of the Treadwell Yukon Co., Ltd.

### PERSHING COUNTY

*Central district.*—Lessees shipped 348 tons of silver ore from the Keystone mine to a smelter in 1938; the ore contained 10 ounces of gold, 12,166 ounces of silver, 306 pounds of copper, and 18,089 pounds of lead.

*Haystack district.*—The Jungo Star Gold Mines Co. shipped 511 tons of ore to a smelter during 1938; the ore contained 631 ounces of gold and 144 ounces of silver.

*Hualipi district.*—In 1938 lessees on the Bucks Head mine, 19 miles north of Gerlach, shipped to a smelter 45 tons of ore which contained 115 ounces of gold, 173 ounces of silver, 135 pounds of copper, and 2,656 pounds of lead.

*Imlay district.*—The largest output in the Imlay district in 1938 came from the Willow Creek drift placer worked by lessees.

*Kennedy district.*—Gold ore was shipped in 1938 for smelting from the Gold Note mine. Small shipments of ore were reported from the Black Hawk and Sunnyside mines also.

*Rochester district.*—Gold ore mined at the Looney property during 1938 was treated by amalgamation and concentration. The Wabash Quartz Mining Claim Corporation, Ltd., shipped from the Wabash mine 170 tons of smelting ore containing 1 ounce of gold, 6,774 ounces of silver, 651 pounds of copper, and 9,514 pounds of lead.

Digitized by Google

*Rosebud district.*—The Gold Box Mining Co. shipped gold ore from its mine in the Box Canyon section of the Rosebud district during 1938. More than 400 ounces of placer gold recovered by small-scale methods, mostly dry washing, were reported for the Rosebud district.

*Seven Troughs district.*—Most of the output of the Seven Troughs district in 1938 was credited to various lessees on properties of the Nevada State Gold Mines Co.

### STOREY COUNTY

*Comstock district.*—Several small-scale operators worked parts of the California and Virginia claims of the Consolidated Virginia Mining Co. during 1938; the most productive operation was on dump material removed from the mine in about 1912 and recovered from the Sutro tunnel dump. Sutro Tunnel Coalition, Inc., continued cyaniding gold-silver ore mined at the Crown Point property. During the early months of the year the Arizona Comstock Corporation worked the section of the Comstock Lode covered by the Gould and Curry, Savage, Hale and Norcross, and Chollar-Potosi claims. Later the company went into receivership, and after a period of litigation the Consolidated Sierra Mining & Milling Corporation took over the property; the former company treated a substantial quantity of gold-silver ore, but the latter organization had not begun production at the mines by the end of 1938. The Dayton Consolidated Mines Co. worked the Justice and Keystone mines and hauled the ore by truck to its cyanide plant at the Dayton mine, a mile or two south, in the Silver City district of Lyon County. Storey County Mines, Inc., worked the Overland mine during 1938; a 100-ton cyanide leaching plant was added to the company 40-ton flotation mill. The Consolidated Chollar Gould & Savage Mining Co. worked the Overman mine throughout the year, treated 121,539 tons of ore by amalgamation and flotation, and produced 1,006 tons of concentrate; the bullion contained 395 ounces of gold and 275 ounces of silver, and the concentrates contained 8,892 ounces of gold, 169,815 ounces of silver, and 3,182 pounds of copper. The Silver Hill Mining Co. worked the Silver Hill property (Lucerne-Echo claims) both on company account and through lessees throughout the year; the company mill, which did a substantial custom business, was enlarged to 100 tons daily capacity. Production was recorded from the Succor mine. Sierra Nevada, Ltd., which operated the Sierra Nevada mine, was one of the larger producers in the Comstock district during 1938; a large slide of waste into the company open-cut seriously affected output late in the year.

### WASHOE COUNTY

*Granite Range district.*—In 1938 W. H. Swank and L. E. Donner, owners of the Mountain View mine, shipped to smelter 838 tons of ore which contained 340 ounces of gold and 1,844 ounces of silver.

*White Horse district.*—The work of several lessees on the Texas No. 2 property made it the most productive in the White Horse district in 1938.

### WHITE PINE COUNTY

*Cherry Creek district.*—Silver ore was shipped from the Black Metal mine to the McGill smelter of the Nevada Consolidated Copper Corporation in 1938. Lessees on the Egan mine shipped gold-silver ore

Digitized by Google

and old tailings to this smelter. The Nevada Standard Mining Corporation, leading operator in the Cherry Creek district in 1938, shipped gold-silver ore. Lessees were active at the Wide West mine.

*Granite district.*—Lessees at the Stinson mine in 1938 shipped to smelter 182 tons of ore which contained 236 ounces of gold and 68 ounces of silver.

*Osceola district.*—The Nevada Tex Mining Co. shipped smelting ore from the Gilded Age and Woodman mines during 1938. The Placers Recovery Co., operator of the Hampton hydraulic placer mine, was the leading producer of placer gold in the Osceola district.

*Robinson district.*—The Consolidated Coppermines Corporation operated throughout 1938. The copper ore, all produced on company account, was shipped to the concentrator of the Nevada Consolidated Copper Corporation at McGill for treatment; various lessees were responsible for the dry ore produced at the company's extensive holdings in the Robinson district. According to the printed annual report of the company for the year ended December 31, 1938, 1,953,215 tons of ore mined on company account yielded 40,140,763 pounds of copper, 20,901 ounces of gold, and 44,163 ounces of silver; 11,562 tons of lessee ore yielded 1,593 ounces of gold, 47,998 ounces of silver, and 2,445 pounds of lead. D. F. Paine worked the Hayes mine, and L. Piombo worked the Jupiter mine. The Ely Gold Mining Co. shipped a substantial quantity of gold ore for smelting from the Revenue mine. The Nevada Consolidated Copper Corporation, operating subsidiary of the Kennecott Copper Corporation and the largest industrial company in Nevada, worked the Ruth mine at Ruth and its open pit at Copper Flat throughout 1938 except for a shut-down from June 15 to August 1; it handled more ore and produced more copper than any other operation in the State. In addition to its mining activities the company operated the McGill copper smelter (only smelter in the State) and the McGill flotation concentrator (18,000 tons daily capacity); both of these plants did custom work. Gold-silver ore was shipped to the McGill smelter from the Sophie mine. C. Caviglia shipped old tailings from the Steptoe Creek tailings dump for smelting.

*White Pine district.*—Small quantities of ore and old tailings, containing chiefly silver, were produced at mines in the White Pine district during 1938.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN NEW MEXICO

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 415 | Metallurgic industry | 420 |
| Calculation of value of metal production | 415 | Review by counties and districts | 424 |
| Mine production by counties | 418 | | |
| Mining industry | 419 | | |
| Ore classification | 420 | | |

The mine production of recoverable gold in New Mexico in 1938 increased in both quantity and total value over 1937, as the price remained the same in both years. The production of recoverable zinc also gained in quantity, but the total value was less than in 1937 because of the reduced average price. The output of recoverable silver, copper, and lead decreased in both quantity and value. The decrease in quantity is attributable almost entirely to curtailment of production by three important producers in the Central district, Grant County; and part of the large decrease in total value of each of these three metals resulted from the decline in average price. There was an increased output of zinc in the Central district; of gold and silver in the Mogollon district, Catron County, and Steeple Rock district, Grant County; and of copper, gold, and silver in the Lordsburg district, Hidalgo County. Production of gold, silver, copper, lead, and zinc from the Pecos mine in the Willow Creek district, San Miguel County, was slightly higher than in 1937.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

*Gold.*—The principal gold-producing districts in New Mexico in 1938 were: Willow Creek (Pecos mine), in San Miguel County, which yielded 32 percent of the State total recoverable output of gold; Mogollon, Catron County, 21 percent; Steeple Rock, Grant County, 13 percent; Lordsburg, Hidalgo County, 8 percent; Mount Baldy, Colfax County, 8 percent; and the Hillsboro district, Sierra County (mostly from placers), 6 percent. The table under the heading Review by Counties and Districts lists all the mining districts of the State that produced in 1938 and shows the production of each district. The principal gold-mining districts of New Mexico are described in Information Circular 6987, issued by the Bureau of Mines.[1] Dry and siliceous ores yielded 49 percent of the total gold; zinc-lead ore, 32 percent; copper ore, 12 percent; and placers, together with a small quantity from lead and lead-copper ores, 7 percent.

*Silver.*—Silver production (in terms of recoverable metal) in New Mexico in 1938 decreased 1 percent from 1937. Substantial increases in the Mogollon, Lordsburg, and Steeple Rock districts were more than offset by a large decrease in the Central district. The Mogollon district produced 35 percent of the State total, Willow Creek 26 percent, Steeple Rock 19 percent, and Lordsburg 11 percent. Dry and siliceous ore, chiefly from the Mogollon and Steeple Rock districts, yielded 59 percent of the total; zinc-lead ore, largely from the Willow Creek and Central districts, 27 percent; copper ore, mostly from the Lordsburg district, 12 percent; and lead-copper and lead ores, together with a very small quantity from placers, 2 percent.

*Copper.*—The Chino Mines Division of the Nevada Consolidated Copper Corporation at Santa Rita produced the bulk of the State output of recoverable copper in 1938 but reduced its production considerably from that of 1937. The total copper output of New Mexico in 1938 decreased 36 percent in quantity and 48 percent in value from 1937. The second-largest producer of copper in the State in 1938 was the Banner Mining Co., operating the Bonney mine 6 miles south of Lordsburg. Most of the remainder of the copper was recovered in concentrates produced from zinc-lead ore of the Pecos mine at Tererro. Copper ore yielded more than 96 percent of the total copper, zinc-lead ore 3 percent, and other types of ore less than 1 percent.

*Lead.*—The production of recoverable lead in New Mexico in 1938 decreased 24 percent in quantity and 41 percent in value from 1937. Most of the decrease in quantity was caused by the shut-down of the Ground Hog-San Jose group and Combination mine in the Central district, Grant County, after April 1938. The Pecos mine in the Willow Creek district, San Miguel County, yielded 86 percent of the State total lead in 1938.

*Zinc.*—The quantity of recoverable zinc in ores and concentrates shipped from New Mexico mines and mills in 1938 increased 18 percent over 1937, but the total value was 13 percent less because of the decline in average price. Two of the large zinc-producing mines—the Pecos at Tererro, San Miguel County, and the Hanover in the Central district, Grant County—were operated continuously in 1938. The Pewabic mine, also in the Central district and an important

[1] Metzger, O. H., Gold Mining in New Mexico: Bureau of Mines Inf. Circ. 6987, 1938, 71 pp.

Digitized by Google

producer during the year, was in operation from March to June, inclusive, and from October 15 to December 31. The other mines in New Mexico that produced recoverable zinc in 1938—comprising the Ground Hog-San Jose, Combination, and Peerless groups, also in the Central district; Grandview in the Swartz district, also in Grant County; Waldo at Magdalena, Socorro County; and Iron King in the Kingston district, Sierra County—shipped ore for only a few months in the first part of the year.

## MINE PRODUCTION BY COUNTIES

*Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1938, by counties, in terms of recovered metals*

| County | Mines producing | | Gold (lode and placer) | | Silver (lode and placer) | |
|---|---|---|---|---|---|---|
| | Lode | Placer | Fine ounces | Value | Fine ounces | Value |
| Bernalillo | 1 | | 4.40 | $154 | 3 | $2 |
| Catron | 6 | | 8,960.40 | 313,614 | 429,847 | 277,881 |

## MINING INDUSTRY

Separation of the 166 lode properties producing 2,414,857 tons of ore in New Mexico in 1938 into groups according to quantity of ore sold or treated shows: 10 mines operated by the larger companies, which have invested much money in equipment, maintain staffs of engineers, geologists, and metallurgists, and employ many men, produced 2,392,329 tons of ore; about 30 mines worked by owners, lessees, and small companies, which employed several men and in general used air compressors, air drills, and gasoline or electric hoists (and in some instances operated small ore-reduction mills), produced about 19,150 tons; and the remaining 126 operations, comprising chiefly individuals working alone or in small groups on widely scattered mines, prospects, and dumps and using man power in their operations, produced about 3,378 tons. The ore produced by the 10 mines in the first group yielded 86 percent of the State total output of gold from lode mines, 91 percent of the silver, 93 percent of the lead, 99 percent of the zinc, and more than 99 percent of the copper.

Digitized by Google

The output of gold from placers also came mostly from properties equipped for large-scale production; four operators, handling approximately 353,000 cubic yards of gravel during the year and using draglines and power shovels and land washing plants, recovered 79 percent of the State total placer gold. Specific data on yardage handled at small-scale placer operations are not obtainable because of lack of knowledge by the operators of the quantity of gravel sluiced.

### ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in New Mexico in 1938, with content in terms of recovered metals*

| Source | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|
| | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |

## METALLURGIC INDUSTRY

Most of the ore-reduction plants operating in New Mexico in 1938 were straight flotation mills and were used to treat ores containing all or a large part of their value in copper, lead, and zinc. The Aztec mill in the Mount Baldy district, Colfax County, treated gold-silver-copper ore by flotation but used a jig and amalgam barrel in the ball mill-classifier circuit to recover some of the gold and silver. The Little Fanney mill at Mogollon, Catron County, was the only cyanidation mill in operation in the State during the year.

*Mine production of metals in New Mexico in 1938, by methods of recovery, in terms of recovered metals*

| Method of recovery | Material treated | Gold | Silver | Copper | Lead | Zinc |

[1] Cyanide used was 235,600 pounds of Aero Brand calcium cyanide, approximately 48 to 49 percent NaCN.

Construction work on the new copper smelter at the Chino concentrator at Hurley, Grant County, which was in progress throughout 1938, was completed early in 1939, and the smelter began treating Chino concentrates May 2. All markets for other New Mexico ore and concentrates are outside the State.

[1] District lies in both Grant and Hidalgo Counties.

Digitized by Google

### BERNALILLO COUNTY

*Coyote district.*—Sinking of a 10-foot shaft on each of four newly discovered claims 14 miles east of Albuquerque in sec. 6, T. 9 N., R. 5 E., New Mexico principal meridian, resulted in the shipment of 11 tons of oxidized gold ore to the El Paso smelter in 1938.

### CATRON COUNTY

*Mogollon district.*—The Mogollon was the largest silver-producing district in New Mexico in 1938 and ranked second in gold production. The output of silver increased from 310,450 fine ounces in 1937 to 429,847 ounces in 1938, and gold from 7,559 to 8,960 ounces. The Black Hawk Consolidated Mines Co., the only larger operator in the district in 1938, maintained steady shipments of gold-silver bullion to the Denver Mint throughout the year from the Little Fanney 200-ton cyanide mill at Mogollon. The company holds the mill and the Consolidated group, comprising the Andrew Jackson Consolidated, Lexington Contention, and Lexington Gunboat claims on the Queen vein, under lease from the Lehigh Metals Co. The mill treated 64,352 tons of ore in 1938 compared with 45,508 tons in 1937. In 1938 the mill feed included 4,135 tons of custom ore from the Maud S group and 2,312 tons from the Last Chance, both worked by lessees—the Maud S for the entire year and the Last Chance from April 1 to December 31. Some of the ore produced at the Last Chance group was shipped crude to the El Paso smelter. The 150-ton Deadwood flotation mill, which was run part of 1937 by the Mogollon Consolidated Mines Co., was idle all of 1938. The Bearup mine was operated on a small scale during January, February, and March 1938 and produced about 60 tons of ore, of which 21 tons containing 4.43 ounces of gold and 164 ounces of silver were shipped to the El Paso smelter during the year. Small lots of ore were shipped from two other claims in the district in 1938.

### COLFAX COUNTY

*Mount Baldy district (Baldy, Elizabethtown, Eagle Nest).*—The Aztec mine, owned and operated by the Maxwell Land Grant Co., continued in 1938 to be the principal producer in the Mount Baldy district. The ore was treated in the company 140-ton flotation mill. During the year the company installed a jig in the ball mill-classifier circuit and an amalgam barrel to treat the jig concentrates. The yield from 17,831 tons of newly mined ore and 525 tons taken from dumps was 337 tons of concentrates, containing 2,305.85 ounces of gold, 820 ounces of silver, and 28,288 pounds of copper, shipped to the El Paso smelter and amalgam retorts and metallics, containing 474.60 fine ounces of gold and 77 ounces of silver, shipped to the Denver Mint. Some of the ore treated came from the Montezuma mine and Ponil group dumps. Additional ore from the Montezuma mine, operated continuously by I. E. Pippert under lease from the Maxwell Land Grant Co., was shipped to the El Paso smelter. A lessee at the Virginia Hutchinson mine, also owned by the Maxwell Land Grant Co., shipped 2 tons of smelting ore and recovered a few ounces of gold by hand methods. The French Henry mine was under develop-

Digitized by Google

ment from July to December. Some placer mining was done on Willow, Ute, and South Ponil Creeks.

### DONA ANA COUNTY

*Organ district.*—The Mormon mine was operated on a small scale in 1938. It is opened by three shafts—one 205 feet, one 150 feet, and one 110 feet deep—but they were accessible in 1938 only to the water level 90 feet from the surface. Stoping and drifting above the water level yielded 48 tons of ore, most of which was treated in a 6-ton amalgamation mill at the mine. The remainder of the ore and some old tailings from previous operations were shipped to the El Paso smelter.

### GRANT COUNTY

*Burro Mountain district (Tyrone).*—The Standard Silver Lead Mining Co. purchased the Malone mine in January 1938 and operated it to the end of the year. The company did 880 feet of development work and shipped gold-silver ore to the El Paso smelter. Small lots of ore were shipped from the Calcutta, Little Wonder, Petanke, and Shamrock properties.

*Central district (Bayard, Fierro, Georgetown, Hanover, Santa Rita).*—The Chino open-pit mine of the Nevada Consolidated Copper Corporation, an operating subsidiary of the Kennecott Copper Corporation, at Santa Rita is the largest producer of copper in New Mexico. The ore is mined with electric shovels, 11 of which were in use in 1938, and is transported 10 miles over the Atchison, Topeka & Santa Fe Ry. to the company 15,000-ton flotation mill at Hurley for treatment. The concentrates produced contain, besides copper, a little gold and silver and some molybdenite. The separation of molybdenite from the copper concentrates at Chino was first reported in the annual report of the Kennecott Copper Corporation for 1937. The Twenty-Fourth Annual Report of the Kennecott Copper Corporation, dated March 21, 1939, contains the following paragraphs pertaining to its domestic mining operations and Chino property in 1938:

> A total of 16,681,931 tons of ore having a calculated average assay of 1.10 percent copper was treated at the five domestic properties of the Corporation. Copper production amounted to 334,816,884 pounds, a reduction of about 44 percent compared to the 598,733,371 pounds produced in 1937. A relatively heavy stripping program carried on at the power shovel properties in Utah, Nevada, and New Mexico resulted in the removal of approximately 30,225,000 tons of noncommercial overburden. In terms of ratio, 1.95 tons of overburden were removed for each ton of ore mined by shovels at these properties in 1938 whereas in 1937 the ratio was 1.10 tons to 1.
>
> Copper production at the Chino property in New Mexico was suspended from June 22 until October 15 and during the remainder of the year was curtailed in keeping with the general production policy. The new coarse-crushing plant and car dumper operated efficiently. A number of new wells were drilled and a water supply developed which is adequate for the treatment of fully 20,000 tons of ore per day. Construction of the new smelter has progressed without interruption and will be completed in advance of the expiration on March 22, 1939, of the contract with the El Paso smelter which provides that all concentrates produced prior to expiration be shipped to El Paso. Consequently it will probably be May 1 before sufficient concentrates can be accumulated to form a working stock for the steady operation of the new plant. Capital expenditures at the Chino property amounted to $2,622,000, most of this representing outlay on the new smelter.

The Hanover zinc mine and 300-ton flotation mill of the Empire Zinc Co. were operated continuously in 1938. The concentrates

Digitized by Google

produced were shipped to plants of the New Jersey Zinc Co. at Palmerton, Pa., and Depue, Ill. (Mineral Point Zinc Division); to the American Zinc Co., East St. Louis, Ill. (for roasting); and to the American Zinc & Chemical Co., Langeloth, Pa. The Peru Mining Co. operated its Pewabic mine at Hanover and 500-ton mill at Wemple near Deming during March, April, May, and June 1938 and then suspended production. The property was shut down until October 15, when the mine and mill were leased to the Callahan Zinc-Lead Co., which operated them to the end of the year. The mill product is lead-free zinc concentrates, which are roasted at Wemple and shipped to the zinc smelter of the Illinois Zinc Co. (parent company of the Peru Mining Co.) at Dumas, Tex. The mine and mill were again shut down early in 1939 and were still idle when this report was written (May 1939).

The Ground Hog and San Jose mines, operated as a unit by the American Smelting & Refining Co. for the past 10 years, have been important producers of silver, lead, zinc, and copper, and a large part of the ore has been treated in custom mills. In April 1938 the company ceased shipping to the 200-ton Combination custom mill of the Black Hawk Consolidated Mines Co. at Hanover, which had received the bulk of its mill feed from these mines since 1930, and as a result the mill was closed. The Combination mine, operated by the Black Hawk Consolidated Mines Co. from January to April 30, also was closed. Later in 1938 the American Smelting & Refining Co. leased the mill and made some changes necessary for the handling of Ground Hog ore which changed somewhat in character as development proceeded downward to the 1,600-foot level. In April 1939 the mill was placed in operation on company and custom ores. The Peerless Mining & Milling Co. continued developing the Peerless mine from January to June 1938 and shipped zinc-lead-silver ore to the Combination mill and zinc-lead ore to the Ozark Smelting & Mining Co. pigment plant at Coffeyville, Kans. From July 1 to the end of the year the development work was financed by the American Smelting & Refining Co. under an option to purchase. Development as of January 1, 1939, comprised a 330-foot shaft and 1,395 feet of drifts and crosscuts. Ore was shipped direct to smelters from the Hanover-Bessemer Iron & Copper Co. group, Gold Frog group, and one other property in the Central district. Elayer & Matthews, working the Cash and Gold Spot claims near Vanadium, recovered a few ounces of gold by washing ore in a sluice box and also mined some ore to be shipped to the smelter in 1939. Individuals recovered a little gold from small placers in 1938.

*Gold Hill district* (*see also Hidalgo County*).—Small lots of ore were shipped in 1938 from the Old Spanish, Robert Lee, Silver Dollar, and Yellow Queen claims and a prospect in the Gold Hill district to the El Paso smelter, to Ira L. Wright at Silver City, and to Hawley & Hawley at Douglas, Ariz.

*Lone Mountain district.*—A lessee at the My Chance claim shipped a 1-ton lot of silver ore in 1938.

*Pinos Altos district.*—The metal output of the Pinos Altos district in 1938 was derived chiefly from ore produced by many small-scale operations and shipped direct to the El Paso smelter or sold in small lots to Ira L. Wright at Silver City and Hawley & Hawley at Douglas, Ariz. The Calumet 20-ton gravity-concentration mill was operated by lessees part of the year as a custom plant and treated about 580

Digitized by Google

tons of ore from the Mammouth tailings dump and Campo Santo and Mountain Key mine dumps and 180 tons from the Silver Hill and Ohio mines. Remodeling of the mill to include flotation was completed early in 1939. Other producing mines and dumps included the Bonanza No. 3, Florence, Geo. Schafer, Golden Rule, Hazard, Houston-Thomas, Kept Woman, Langston, Lupita group, Oak Grove, Rich Gulch, and Wild Horse. Individuals continued to work small placers near Pinos Altos intermittently with rockers and sluices.

*Red Rock district.*—Three tons of copper-silver ore—2 tons from the Friendship claim and 1 ton from the Good Luck—were shipped from the Red Rock district in 1938.

*Steeple Rock district.*—Shipments of dry and siliceous gold-silver ore from the Steeple Rock district to smelters in Arizona and Texas were continued in 1938. Production from the East Camp group, operated throughout the year by the East Camp Exploration Syndicate, was 8,029 tons of ore averaging 0.36 ounce of gold and 23.71 ounces of silver to the ton; the ore also contains a little copper and lead. The mine is developed by a vertical shaft 300 feet deep, 100 feet of winzes, 1,400 feet of raises, and 3,000 feet of drifts. Veta Mines, Inc., continued to ship newly mined ore and old tailings from the Carlisle group. The ore contains principally gold and silver, with minor quantities of pyrite, galena, chalcopyrite, and sphalerite. As the ore shipped in 1938 went to copper smelters none of the zinc was saved. The section of the mine from which production was made in 1938 is opened by an incline shaft 140 feet deep, 500 feet of drifting, and a 90-foot winze. The old workings on the property were not reopened. Lessees at the Alabama and Laura mines shipped a substantial quantity of ore during the year. Other producers of a car or more of ore in 1938 included the Gold King, Norman King, and Twin Peaks mines.

*Swartz (or Carpenter or Camp Monarch) district.*—The Black Range Development Co. drove 200 feet of tunnel at the Grandview group 30 miles east of Santa Rita and shipped 80 tons of ore, containing 35,662 pounds of lead and 39,826 pounds of zinc, to the Ozark Smelting & Mining Co. pigment plant at Coffeyville, Kans.

*White Signal district.*—Placer ground of Sunset Gold Fields, Inc., in Gold Gulch was under development by a lessee from February 1 to December 31, 1938. The property is equipped with a power shovel and portable Ainlay bowl recovery plant, which was run for a period and produced nearly all the metal output of the White Signal district in the year. The remainder was recovered by individuals sluicing at small placers in the same area.

### HIDALGO COUNTY

*Apache district.*—The development work begun in 1937 by the United States Smelting, Refining & Mining Exploration Co. on the Monarch and Copper Crown claims of the Apache group was continued to June 3, 1938, when work was discontinued and the lease terminated.

*Gillespie district.*—The Red Hill Mining Co. operated the Red Hill group, opened by a 500-foot vertical shaft and several thousand feet of drifts and crosscuts, from July 1 to September 1, 1938, and shipped lead-silver-gold ore to the El Paso smelter.

Digitized by Google

*Gold Hill district* (*see also Grant County*).—The Sweet Mining Co. shipped 62 tons of gold-silver-lead ore from a prospect to the El Paso smelter in 1938. The remainder of the output of the Gold Hill district comprised 2 tons of gold-silver ore from the Big Chief claim and 5 tons of gold-silver-lead ore from the Oro Grande.

*Lordsburg district.*—The Banner Mining Co. operated the Bonney mine and flotation mill 6 miles south of Lordsburg continuously in 1938. Although the company maintained production at a higher rate than in 1937, it proceeded with development of the lower levels of the mine and sank the vertical main shaft an additional 150 feet, giving it a total depth of 1,020 feet at the end of 1938; development work done during the year totaled 6,272 feet. The product of the mill is copper-gold-silver-[iron] concentrates, which are sold to the El Paso smelter. Lessees working the Belle, Depression, Nellie Bly, Silver Dollar, and other properties in the Lordsburg district on a small scale continued to make intermittent shipments of newly mined and sorted dump ore to the El Paso smelter and to Hawley & Hawley at Douglas, Ariz.

*San Simon district* (*Steins*).—Prospecting and development were continued at the Paint Horse group in 1938, and small lots of high-grade gold ore were shipped.

*Sylvanite district.*—The Sylvanite Gold Mining Co. operated its Buckhorn-Barney-Woods group 16 miles southwest of Hachita from January 1 to December 15, 1938. Most of the ore produced was shipped direct to the El Paso smelter. The mine is opened by a vertical shaft 200 feet deep, a tunnel, and drifts. It is equipped with a 20-ton concentration mill. A car of silver-lead ore from the Eagle claim and small lots of the same type of ore from the Last Chance and Dodge claims were shipped to the El Paso smelter.

### LINCOLN COUNTY

*Jicarilla district.*—Placer miners continued to recover gold by rocking, sluicing, and drift mining in 1938 in the Jicarilla Mountains southeast of Ancho. At a few placers machinery was used to handle the gravel. Most of the gold produced was sold in small lots to merchants at Jicarilla and Ancho.

*Nogal district.*—During July 1938 Great Western Mines, Inc., treated in a small amalgamation mill 30 tons of ore from an open-cut on its property. Only 11 tons of ore were shipped to smelters from mines and prospects in the Nogal district in 1938.

*White Oaks district.*—The Lincoln County Mining & Milling Co. shipped a car of lead-silver-gold-copper ore to the El Paso smelter in 1938, and a little gold was recovered at a placer mine in the White Oaks district.

### LUNA COUNTY

*Cooks Peak district.*—Lead-silver ore was shipped in 1938 from the Lookout mine and Ethel-"85" group to the El Paso smelter and to Ira L. Wright at Silver City.

*Deming.*—The Peru 500-ton selective flotation mill at Wemple near Deming was operated in 1938 by the Peru Mining Co. at an average daily rate of 330 tons from March to June, inclusive; it was idle from July to October 15, when it was started up under lease by the Callahan Zinc-Lead Co. and treated an average of 323 tons daily to the

Digitized by Google

end of the year. The ore treated by both companies was lead-free zinc sulfide ore from the Pewabic mine at Hanover, Grant County.

*Victorio district.*—In 1938 Shanks Carpenter continued to ship oxidized gold-silver-lead-[zinc]-iron-lime ore from the Victorio group 4 miles south of Gage to the El Paso smelter. The mine is developed by a 300-foot vertical shaft, a 700-foot adit, and 4,000 feet of other workings.

### OTERO COUNTY

*Orogrande district.*—A lessee worked the Center placer with a dry washer and pan from January 1 to April 15, 1938, and recovered 6.50 ounces of dust 0.915 fine in gold. About the same quantity of gold was recovered from another placer in the Orogrande district in 1938.

### RIO ARRIBA COUNTY

*Headstone district.*—The A. J. S. Mining Co. erected a mill at the Badger-Hidden Treasure group in 1938 and operated it for a short period late in the year. An individual prospecting on placer ground near Tres Piedras recovered a little placer gold.

### SANDOVAL COUNTY

*Cochiti (Bland) district.*—Lessees shipped several cars of gold-silver ore from the Lone Star mine to the El Paso smelter in 1938. A lessee at the old Cossak cyanidation mill cleaned up and shipped to the smelter 4 tons of high-grade gold- and silver-bearing material.

### SAN MIGUEL COUNTY

*Willow Creek district (Tererro).*—The Pecos mine of the American Metal Co. of New Mexico was operated continuously in 1938, its twelfth year of production. The mine has been productive to a depth of 1,700 feet, but the levels below 1,200 feet were abandoned prior to 1938 and operations during 1938 were conducted on levels 1,200 to 400, inclusive. The flow of water continued at an average rate of 1,800 gallons per minute, most of which was pumped from the 1,200-foot level. The ore is treated in the company 600-ton selective flotation mill in Alamitos Canyon. The mill feed in 1938 was 203,900 tons of ore averaging 0.086 ounce of gold and 2.27 ounces of silver to the ton, 0.51 percent copper (wet assay), 2.99 percent lead (wet assay), 8.07 percent zinc, and 11.32 percent iron. The yield was 24,819 tons of zinc concentrates—averaging 0.048 ounce of gold and 3.53 ounces of silver to the ton, 0.96 percent copper (wet assay), 1.03 percent lead (wet assay), 53.52 percent zinc, and 7.53 percent iron—and 12,285 tons of lead-copper concentrates—averaging 1.06 ounces of gold and 21.96 ounces of silver to the ton, 4.08 percent copper (wet assay), 38.68 percent lead (wet assay), 11.08 percent zinc, and 12.32 percent iron. On May 31, 1939, the mine was closed.

### SANTA FE COUNTY

*Ortiz Mountains district (Cerrillos).*—A small output of gold-silver ore was made from the Chord mine in 1938, and some gold was recovered at small placers in the Ortiz Mountains district.

Digitized by Google

*San Pedro or New Placers district.*—Lessees at the San Pedro copper mine on the south slope of the San Pedro Mountains 20 miles west of Stanley continued to ship copper-gold-silver ore to the El Paso smelter in 1938. In the first part of the year the mine was purchased by John J. Raskob, who had made geophysical and geological examinations of the mine followed by diamond drilling in 1939. A lessee at the Lincoln-Lucky-Amazon group shipped several cars of lead-silver-gold-copper ore. A few tons of copper-gold-silver ore were shipped from the Delgado and other properties in the San Pedro district. Ore from the Old Timer dump and Captain Davis claim was treated in small amalgamation mills. Most of the output from placers in 1938 was made by lessees sluicing at the Lazarus placer. Individuals continued to recover small lots of dust from other placers.

### SIERRA COUNTY

*Chloride (Apache, Cuchillo Negro) district.*—In 1938 individuals residing at Winston hauled a few truckloads of ore obtained from leasing and prospecting operations in the Chloride district to the El Paso smelter.

*Kingston district.*—During the first few months of 1938 the lessee on the Iron King mine in the Kingston group of the Empire Zinc Co. continued to ship zinc-lead-silver-copper ore to the Black Hawk Consolidated Mines Co. concentrator at Hanover, Grant County, for treatment. J. H. Moffitt, owner of the Cumberland group, shipped about 7 cars of silver-gold-lead-copper ore to the El Paso smelter. A 2-ton lot of lead ore was shipped to the smelter from another property in the Kingston district.

*Lake Valley district.*—A car of silver-lead-copper ore was shipped from the Lake Valley group to the El Paso smelter in 1938.

*Las Animas district (Hillsboro).*—The chief producer of gold in the Las Animas district in 1938, as in each year since 1934, was the John I. Hallett Construction Co. placer operation on a consolidated group of leased properties (including the Gold Dust, Graf Von Luxemburg, and others), 8 miles east of Hillsboro. The equipment consists of two gasoline-powered dragline excavators of 1 and 1¼ cubic yards capacity, a Coulter-Ainlay four-bowl recovery plant mounted on wheels, water-storage tanks, and pumps. Clarence Berg operated a ¾-cubic yard dragline and home-made portable dry-washing plant at the Gordon-Sylvia (or Wilder) placer from March 29 to May 27 and recovered 76 fine ounces of gold. Sluicing, panning, and dry washing at small placers produced some gold.

The Wicks lode mine in Wicks Gulch was shut down from January 1 to October 27, 1938; then it was leased to Drunzer & Everhart, who shipped some ore to the El Paso smelter before the end of the year. Small-scale operations, mostly by lessees, at the Biglow, Bonanza, Duke, El Oro, Gold Coin, Litel King, Lucky Strike, M. K. T., Ready Pay, Sherman, and other properties in the Hillsboro district yielded many small lots of gold-silver-copper ore, which were sold to the El Paso smelter, to Hawley & Hawley at Douglas, Ariz., and to Ira L. Wright at Silver City, N. Mex.

*Pittsburg district.*—Most of the output of gold and silver from the Pittsburg district in 1938 was contained in small lots of placer dust

Digitized by Google

recovered by individuals sluicing and panning over a considerable area; the dust was marketed through a general store at Hatch.

### SOCORRO COUNTY

*Good Fortune district (40 miles west of Tularosa).*—A lessee worked the Belle Vista prospect during July and August 1938 and shipped a 2-ton lot of oxidized copper ore to the El Paso smelter.

*Hansonberg district* (17 miles southeast of Carthage).—In 1938 one of the owners of the Louise-Halsbad group worked at the property 30 days in May and June and 6 days in November. The ore shipped contained about 43 percent lead and 2.50 ounces of silver and 0.025 ounce of gold to the ton.

*Magdalena district.*—During January and February 1938 lessees at the Waldo mine of the Ozark Smelting & Mining Co. continued to ship zinc ore to the company pigment plant at Coffeyville, Kans.; the mine was idle from March to the end of the year. The Mistletoe mine was worked by lessees for a period and produced most of the gold-silver-lead ore shipped from the Magdalena district in 1938. A few lots of ore were shipped from prospects during the year.

*San Mateo Mountains district.*—The Panky group of the Springtime Mining Co., closed late in 1936, was idle until the last quarter of 1938 when a lessee did some repair work and made several test runs in the mill, resulting in the shipment of about a ton of high-grade gold-silver concentrates. Ellison Warren worked his claim from January to August and installed a 10-ton amalgamation-gravity concentration mill which he removed after having treated a small quantity of ore; he also shipped some gold-silver ore to the El Paso smelter.

### TAOS COUNTY

*Red River district.*—The Memphis mine was operated by a lessee from January to March 1938. The ore produced was treated in a 30-ton gravity- and flotation-concentration mill at Red River; the product was gold-silver concentrates, sold to the El Paso smelter. The Taos Mining & Milling Co. shipped 13 tons of gold-silver ore to smelters in 1938. A little placer gold was recovered by sluicing at a placer in Box Canyon near Red River.

The Molybdenum Corporation of America continued production of molybdenum ore from the Phyllis group on Sulphur Creek. The ore is treated in the company 40-ton (per 24 hours) flotation mill at the junction of Sulphur Creek and Red River above Questa.

### TORRANCE COUNTY

A car of copper-gold-silver ore, presumably from a prospect in the Manzano Range near Abo Pass, was shipped from Scholle to the El Paso smelter in 1938.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN OREGON

(MINE REPORT)

By CHARLES WHITE MERRILL AND H. M. GAYLORD

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 435 | Mining industry | 439 |
| Calculation of value of metal production | 435 | Ore classification | 439 |
| Mine production by counties | 438 | Metallurgic industry | 440 |
| | | Review by counties and districts | 443 |

The total value of the gold, silver, copper, and lead produced in Oregon during 1938—$2,935,053—exceeded that in every year, except 1916, since the mining industry was begun in 1852. The total in 1938 was divided as follows: Gold, over 97 percent; silver, over 2 percent; and copper and lead combined, less than 1 percent. No output of zinc was reported for the year. Baker County continued to be the leading metal producer and contributed 46 percent of the State total value; Grant County accounted for 28 percent, Josephine County 16 percent, and Jackson County 9 percent; and the other 10 producing counties made up the remaining 1 percent.

An outstanding feature of the metal-mining industry in Oregon in 1938 was the great expansion in production at the Cornucopia mine, Cornucopia district, Baker County. This mine, the largest lode producer in the State in 1937, increased its gold output 250 percent. The aggregate production from lode mines other than the Cornucopia was considerably less than in 1937.

Another important feature in the State's mining industry during 1938 was the greatly increased yardage of gravel handled by dredges, of both the connected-bucket and dragline types. Operations included 5 connected-bucket and 11 dragline dredges in 1938 compared with 4 of each type in 1937. Production by other placer methods continued to be relatively small.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production herein reported has been calculated at the following prices.

| 1937 | [6] 150 | 7,831,000 | 34,219.00 | 1,197,665 | .153 |
| 1938 | 157 | 11,354,891 | 54,331.00 | 1,901,585 | .167 |

[3] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[4] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.
[5] None reported for 1934–37, inclusive.
[6] A mine using more than 1 method of recovery is counted but once in arriving at total for all methods.

*Gold.*—Production of gold in Oregon in 1938 increased 55 percent over 1937; the output from placer mines increased 59 percent and that from lode mines 49 percent. Although 241 properties produced in 1938, the bulk of the gold came from relatively few mines; 13 properties produced 80 percent of the total. Of the placer gold, 54 percent was recovered by dredges of the connected-bucket type, 29 percent by dragline dredges, 7 percent by small-scale hand methods, 6 percent by hydraulicking, and the remaining 4 percent by nonfloating washing plants with mechanical excavators and by drift mines. Virtually all the lode gold was derived from dry and siliceous gold ores or from old siliceous tailings. Smelting of concentrates from concentrating and amalgamating mills recovered 72 percent of the lode gold; amalgamation, cyanidation, and direct smelting of ore recovered the remainder. Of the 10 leading gold producers of the State those ranking first, ninth, and tenth were lode mines, and

Digitized by Google

the rest were dredging operations; the operations ranking fourth and sixth employed dragline dredges and the others connected-bucket dredges.

*Silver.*—Silver production in Oregon in 1938 increased 66 percent in quantity and 39 percent in value over 1937. Baker County yielded 87 percent and Grant County 10 percent of the State total; dry and siliceous gold ore yielded 87 percent and placer gravels 8 percent; and concentration followed by smelting of the resulting concentrates recovered 85 percent of the total. Almost three-fourths of the silver produced in Oregon in 1938 from both lode and placer properties came from the Cornucopia mine, Cornucopia district, Baker County.

*Copper, lead, and zinc.*—Since cessation of operations by the Balm Creek Gold Mining Co. in Baker County and closing of the Silver Peak mine in Douglas County, production of copper in Oregon has been negligible. Likewise, quiescence of the Bohemia district in Lane County eliminated production of zinc in Oregon and had nearly the same effect on the lead output of the State.

## MINE PRODUCTION BY COUNTIES

*Mine production of gold, silver, copper, lead, and zinc in Oregon in 1938, by counties, in terms of recovered metals*

## MINING INDUSTRY

Of the 61,278 tons of ore sold or treated in Oregon during 1938, all but 364 tons was dry and siliceous gold ore; the 13,658 tons of old tailings treated contained no substantial values other than gold. Thus, the great importance to Oregon of gold priced at $35 an ounce is apparent. The increase in Oregon gold production during the last decade has come from relatively few properties. Of the lode gold in 1938, more than two-thirds came from a single property—the Cornucopia mine, Cornucopia district, Baker County. Of the placer gold, two-thirds was recovered by the following five operators: The Sumpter Valley Dredging Co. (connected-bucket dredge), Sumpter district, Baker County; Western Dredging Co. (connected-bucket dredge), Canyon district, Grant County; Ferris & Marchbank (dragline dredge), Canyon district, Grant County; Rogue River Gold Co. (connected-bucket dredge), Greenback district, Josephine County; and B-H Co. (dragline dredge), Upper Applegate district, Jackson County. The foregoing six properties contributed two-thirds of the total value of the State output of gold, silver, copper, and lead in 1938.

### ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore and old tailings sold or treated in Oregon in 1938, with content in terms of recovered metals*

| Source | Material sold or treated | | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|---|

## METALLURGIC INDUSTRY

Of the 74,936 tons of ore (including 13,658 tons of old tailings) sold or treated in 1938 in Oregon, 51,339 tons (including 4,448 tons of old tailings) were produced in Baker County; Josephine County produced 17,476 tons, of which 8,800 tons were old tailings. Of the total, 61 percent was treated in concentrating mills, most of which used flotation; 37 percent was treated in amalgamation and cyanidation mills, with or without concentration equipment; and the remainder was shipped crude for smelting. Seventy-two percent of the lode gold was recovered ultimately by the smelting of concentrates; 11 percent as bullion by amalgamation of ore and old tailings; 10 percent by cyanidation of ore, concentrates, and old tailings; and 7 percent by direct smelting of ore. All material requiring smelting was shipped out of the State, as Oregon has no smelters.

*Mine production of metals in Oregon in 1938, by methods of recovery, in terms of recovered metals*

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 11 and their output included under "Combined districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Source of total silver as follows: 92,206 ounces from lode mines and 8,301 ounces from placers.

[4] Not reported.

[5] Mormon Basin district lies in both Baker and Malheur Counties.

[6] Greenhorn district lies in both Baker and Grant Counties.

[7] Included under "Combined districts."

[8] Exclusive of placer output, which is included under "Combined districts."

[9] Greenback district lies in both Jackson and Josephine Counties.

[10] Exclusive of lode output, which is included under "Combined districts."

[11] Includes following districts: Greenhorn (placer) in Baker County; Rock Creek (placer) in Coos County; Canyonville (placer) and Mount Reuben (placer) in Douglas County; Susanville (placer) in Grant County; Elk Creek (lode) in Jackson County; Galice (lode) in Josephine County; and Gold Butte (lode) in Marion County.

### BAKER COUNTY

*Baker district.*—The dragline dredge working on the Elk Creek Placers was the principal producer in the Baker district in 1938; litigation closed operations in September.

*Cornucopia district.*—The Cornucopia mine, operated by Cornucopia Gold Mines, treated 42,310 tons of gold ore and 1,348 tons of old tailings by flotation during 1938 and became the largest gold producer in Oregon after a record of several years as the largest producing lode mine. The metals recovered from 1,590 tons of concentrates and 8 tons of crude ore shipped to a smelter were: Gold, 18,604 fine ounces; silver, 73,824 fine ounces; copper, 68,071 pounds; and lead, 16,494 pounds.

*Hereford district.*—L. B. Jackson and W. B. Pattison operated during the last 8 months of 1938 a nonfloating washing plant, fed by power shovel, on their property 6 miles east of Hereford.

*Rock Creek district.*—Operations at the Highland Maxwell mine were terminated during 1938.

*Sparta district.*—The Maiden Creek mine, formerly known as the Macy, produced 1,764 tons of gold ore yielding 1,331 ounces of gold and 207 ounces of silver in 1938; it was the largest producer in the Sparta district.

*Sumpter district.*—The Sumpter Valley Dredging Co. operated a connected-bucket dredge, equipped with seventy-two 9-cubic-foot buckets, at its Sumpter Valley Placers throughout 1938 and was the largest producer of placer gold in the State. Consuelo Oregon Mines started production with a dragline dredge in May 1938. H. F. England & Co. operated a dragline dredge in the Sumpter district for 30 days but owing to unsatisfactory recoveries moved to a property near Prairie City in the Quartzburg district, Grant County. Little, Harris, and Wolfinger mined 100,000 cubic yards of gravel with a dragline dredge equipped with a 1½-cubic-yard bucket and produced 714 ounces of gold between October 8 and the end of 1938.

*Virtue district.*—The Hidden Treasure mine was the only large producer in the Virtue district in 1938; 351 tons of ore shipped for smelting yielded 641 ounces of gold and 130 ounces of silver.

### COOS COUNTY

*Johnson Creek district.*—Several small-scale placer operations in 1938 were reported along Johnson Creek.

### CURRY COUNTY

*Port Orford district.*—Dorothy Faris and Associates, the largest producer in Curry County in 1938, suspended operations at the Cape Blanco placer when its lease expired March 29.

### DOUGLAS COUNTY

*Cow Creek district.*—Several small placer operations in 1938 were reported along Cow Creek, particularly at Yokum Bar.

### GRANT COUNTY

*Canyon district.*—Ferris & Marchbank treated 1,512,595 cubic yards of gravel and recovered 7,707 ounces of gold with a Diesel-powered dragline dredge operating on John Day River west of John Day; the

Digitized by Google

equipment consisted also of a Diesel-electric floating washer. The Western Dredging Co. operated a connected-bucket dredge, equipped with seventy-two 6-cubic-foot buckets, throughout 1938. The Miller Mountain mine was the most-productive lode property in the Canyon district.

*Granite district.*—Porter & Co. began operations September 10, 1938, in the Granite district with a connected-bucket dredge, equipped with sixty-two 4½-cubic-foot buckets; the property, owned by the Blue Mountain Gold Dredging Co., is near Granite and adjoins Granite, Olive, Clear, Crane, and Bull Run Creeks. Independence Cougar Mines, which operated the Independence and Cougar groups, shipped 621 tons of ore from which 501 ounces of gold were recovered. At the New York mine 1,030 tons of ore were treated by cyanidation, with a recovery of 204 ounces of gold.

*Greenhorn district.*—The Western Gold Corporation began dragline dredge operations September 8, 1938, on Granite Creek and was the largest producer of gold in the Greenhorn district in 1938. Ore from the Intermountain mine was shipped for smelting.

*Quartzburg district.*—H. F. England & Co. moved its dragline dredge from the Sumpter district in Baker County to the Quartzburg district and began operations October 18, 1938, on Dixie Creek 1 mile from Prairie City; the treatment of 90,000 cubic yards of gravel yielded 513 ounces of gold. Ore from the Yankee Boy group north of Prairie City was treated by amalgamation.

*Susanville district.*—The Timms Gold Dredging Co. operated its connected-bucket dredge, equipped with sixty-four 3½-cubic-foot buckets, throughout 1938 on the Middle Fork of John Day River; it was the chief producer in the Susanville district.

### JACKSON COUNTY

*Ashland district.*—P. B. Wickham continued development at the Ashland mine during 1938 and obtained considerable gold ore that was treated by amalgamation.

*Gold Hill district.*—A lessee worked the Lance Bros. property on Foots Creek with a nonfloating washing plant from the first of 1938 until April 20; 25,700 cubic yards of material were treated to recover 241 ounces of gold. The Black Channel mine, also on Foots Creek, was operated by hydraulicking during the first 4 months of the year. Several other mines, both lode and placer, reported small outputs.

*Upper Applegate district.*—The B-H Co. worked its placer property on Forest Creek by dragline dredging throughout most of 1938. Christean & Dobbyn worked a drift mine on Forest Creek which yielded more gold than any other drift operation in the State. The Glide Foundation operated a dragline dredge on Poorman's Creek part time over a period of 4 months in 1938. Sterling Mines, Inc., worked its hydraulic mine on Sterling Creek and was the second-largest producer of gold recovered by hydraulicking in the State.

### JOSEPHINE COUNTY

*Galice district.*—A large number of small operators were reported active at placer mines in the Galice district during 1938. Small-scale hand methods yielded considerable gold at the Old Channel

Digitized by Google

property. The Lewis Investment Co. worked the Benton mine almost continuously in 1938 and shipped its cyanide precipitates to a smelter; this property, which started operations August 28, 1937, was the second-largest producer of lode gold in Oregon in 1938. A small output of gold ore was reported from the J. C. L. mine during 6 months of operation.

*Grants Pass district.*—Surety Placers, Inc., worked a substantial yardage by hydraulicking at its property on Louse Creek during the early months of 1938; later in the year a lessee started operations. The Lambtongue mine north of Grants Pass produced 343 tons of gold ore, from which 83 ounces of gold were recovered by amalgamation and smelting of concentrates.

*Greenback district.*—The principal producer in the Greenback district—the Rogue River Gold Co.—discontinued operation of its connected-bucket dredge November 30, 1938, after several years of production; the dredge was of the company's own design and construction and was equipped with sixty-five 7½-cubic-foot buckets. The company had perfected a method of water clarification to meet the demands of recreational interests on the lower Rogue River. Gravel was mined at the Blue Channel property on Coyote Creek by hydraulicking in 1938. The Columbia mine was one of the larger producers of gold by hydraulicking in the district and in the State. Hydraulicking at the 3 L's mine on Grave Creek resulted in the recovery of 71 ounces of gold from 11,000 cubic yards of gravel. The recovery of 339 ounces of gold and 321 ounces of silver was reported from the cyanidation of 8,600 tons of old tailings at the Greenback mine. During the year P. B. Wickham, of the Ashland mine in Jackson County, leased this property for a period of 10 years; he had no part in production at the mine in 1938 but did some repair work.

*Illinois River district.*—Small placer and lode operations were reported in the Illinois River district in 1938.

*Lower Applegate district.*—The Oregon Bonanza lode mine was operated throughout 1938; treatment of 187 tons of ore, partly by amalgamation and partly by direct smelting, resulted in the recovery of 349 ounces of gold and 114 ounces of silver.

*Waldo district.*—The recovery of 517 ounces of gold from 100,000 cubic yards of gravel by hydraulicking in 1938 was reported at the Esterly (Llano de Oro) mine; this property was the largest producer of gold recovered by hydraulicking in the State. Several operators worked the Leonard mine on Althouse Creek; virtually all the gold was recovered at a stationary washing plant, to which the gravel was delivered by trucks loaded by power shovels. The Platurica (Plataurica) mine in the O'Brien section of the Waldo district yielded 119 ounces of gold from the hydraulicking of 80,000 cubic yards of gravel during the first 3 months of 1938.

### OTHER COUNTIES

Small outputs in 1938 were reported also from Harney, Lane, Malheur, Marion, Morrow, Union, and Wheeler Counties.

Details of production by counties and districts are given in the preceding table.

# GOLD, SILVER, COPPER, AND LEAD IN SOUTH DAKOTA

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 449 | Mining and metallurgic industry | 451 |
| Calculation of value of metal production | 449 | Metallurgic recovery | 451 |
| Mine production by counties | 451 | Review by counties | 452 |

Gold production in South Dakota set a new annual record in 1938, totaling 594,847 fine ounces valued at $20,819,645. The increase over 1937 was 13,303 ounces and over 1936, the former record year, 8,494 ounces. As usual, the Homestake mine at Lead, Lawrence County, the largest producer of gold in the United States, yielded the bulk of the gold; three other important producers in Lawrence County and one in Pennington County increased their output. Placer mines, mostly on French Creek, produced all the gold shipped from Custer County in 1938. From 1875 through 1938 these three counties, situated in the Black Hills area in the southwestern part of the State, have produced all the State output of gold, silver, copper, and lead. The silver recovered in South Dakota in 1938 was a byproduct of gold mining. No recoverable copper has been produced in the State since 1918 and no lead since 1935.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price: 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

Except for a slight drop in 1937 from 1936, gold production in South Dakota has increased annually over the 5-year period ended with 1938. The quantity of silver recovered varied somewhat in proportion to the gold produced in the individual years but also increased for

Digitized by Google

the period. The only silver recovered other than as a byproduct of gold mining during the 5 years was 1,519 ounces contained in 30 tons of lead-silver ore shipped to a smelter in 1935.

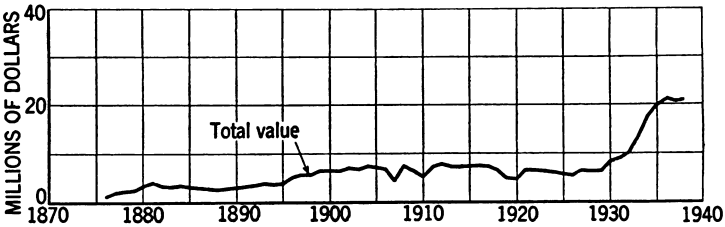

FIGURE 1.—Total value of mine production of gold and silver in South Dakota, 1876–1938.

*Mine production of gold, silver, copper, and lead in South Dakota, 1934–38, and total, 1875–1938, in terms of recovered metals* [1]

| Year | Mines producing | | Ore (short tons) | Gold (lode and placer) | | Silver (lode and placer) | |

## MINING AND METALLURGIC INDUSTRY

The total ore mined and treated by producers of lode gold and silver in South Dakota was 1,586,181 tons yielding 593,778 fine ounces of gold and 162,213 fine ounces of silver in 1938 compared with 1,597,178 tons yielding 580,533 ounces of gold and 139,563 ounces of silver in 1937. The average yield in metals per ton of ore therefore increased slightly in 1938. An analysis of methods of treatment shows that 1,417,222 tons were treated by amalgamation followed by cyanidation of sands and slimes; 155,667 tons by cyanidation only or by roasting followed by cyanidation; 1,169 tons by amalgamation only; 12,000 tons by amalgamation and flotation concentration (237 tons of concentrates containing 729.20 ounces of gold and 170 ounces of silver were shipped to smelters); and 123 tons containing 2,091.09 ounces of gold and 664 ounces of silver were shipped crude to smelters. Operating details at both lode and placer mines are given in the following review by counties.

### METALLURGIC RECOVERY

*Gold and silver bullion produced at mills in South Dakota by amalgamation, 1934–38*

| Year | Ore treated | Gold in bullion | Silver in bullion | Quicksilver used |
|---|---|---|---|---|
| | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* |
| 1934 | 1,441,052 | 310,941.73 | 58,086 | 9,663 |
| 1935 | 1,382,774 | 335,553.97 | 75,858 | 15,550 |
| 1936 | 1,393,450 | 330,052.08 | 66,585 | 15,093 |
| 1937 | 1,414,772 | 329,975.10 | 66,640 | 10,178 |

[1] In terms of 96- to 98-percent strength.
[2] Actually 1,589,300 pounds of calcium cyanide (48- to 49-percent strength) and 69,745 pounds of sodium cyanide (91-percent strength); all reduced to equivalent of 96- to 98-percent strength to conform with earlier use of figures for high-strength NaCN and KCN.

## REVIEW BY COUNTIES

### CUSTER COUNTY

The Sterling Mining Co. operated its dragline and screening and sluicing plant on French Creek, 1 mile west of Custer, from April 13 to November 15, 1938. The Anchor Gold Mining Co. ran a gasoline shovel and washing plant for 30 days on the McKenna property on French Creek. A dragline and sluice were operated from October 1 to November 1 at the Rhodes property on French Creek, 1 mile east of Custer, and recovered 15.18 fine ounces of gold. Small-scale sluicing and panning along French Creek recovered some gold in 1938. No production was made from lode mines in Custer County during the year.

### LAWRENCE COUNTY

*Homestake mine.*—The annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1938, says—

Operations during 1938 were normal in all departments. Ore production from the mine was a little lower than in 1937 and the gross income for gold and silver produced was one-tenth of 1 percent less. Production for 1939 will probably approximate that of 1938.

Operating expenses exclusive of taxes were substantially the same as in 1937. Taxes again increased to a total of $3,052,795.67, or $2.22 per ton of ore mined. The increased tax burden has eliminated a substantial tonnage of marginal ore from the reserve.

There are 189,571 tons of broken ore remaining in shrinkage stopes.

The reserve of developed ore is 18,558,019 tons. Of this reserve 6,446,350 tons are in the new ledge referred to in the report for 1937. The ore developed in this ledge is materially lower in grade than that in the main ledges.

The mine, treatment plants, and other surface plants are in excellent condition. Reconstruction and modernization of Cyanide sand plant No. 1 was completed except for minor alterations of pipes and launders. There was no interruption of operation during construction.

A new operating shaft was authorized in May. It was named the Yates Shaft in memory of Mr. B. C. Yates. This shaft will replace the Ellison Shaft which has for some years been protected by leaving ore pillars. The new shaft will be equipped for an ultimate depth of 5,000 feet. 12,850 feet of connecting drifts for this shaft and 1,576.5 feet of pilot raises in the shaft are completed.

The Ross Shaft is completed to the 4,100-foot level with a 60-foot sump below that level.

The winze from the 4,100-foot level was completed to the 4,400-foot level and 957 feet of level development completed on the 4,400-foot level.

Power output from the hydroelectric plants was slightly less than in 1937. Ample power was supplied from the Kirk power station.

*Ore milled, receipts, and dividends, Homestake mine, 1934–38* [1]

| Year | Ore milled (short tons) | Receipts for bullion product | | Dividends |
|---|---|---|---|---|
| | | Total | Per ton | |
| 1934 | 1,440,692 | $16,515,684.14 | $11.4637 | $7,534,800 |
| 1935 | 1,379,163 | 19,191,013.19 | 13.9150 | 14,064,960 |
| 1936 | 1,383,929 | 19,506,534.78 | 14.0950 | 9,041,760 |
| 1937 | 1,394,773 | 19,304,076.45 | 13.8403 | 9,041,760 |
| 1938 | 1,377,314 | 19,284,459.67 | 14.0015 | 9,041,760 |

[1] From 1876 to 1938, inclusive, this mine yielded bullion and concentrates that brought a net return of $360,075,014 and paid $115,145,722 in dividends.

The system of mining used at the Homestake mine has been described briefly as follows:[1]

The ore body is first cut by a series of stopes each extending for 60 feet along the strike and from wall to wall of the deposit—a distance which may be as great as 400 feet. Pillars of ore 42 feet in thickness separate the 60-foot stopes. A stope is started by making a cut entirely across its bottom. A timbered gangway provided with chute gates is next constructed across the floor of the cut and waste filling is introduced around it. The stope is then carried upward by shrinkage stoping to within about 25 feet of the level above. The interval between levels is 100 feet in the upper part of the mine and 150 feet in the lower. During shrinkage stoping, the miners stand upon the broken ore, enough being drawn off regularly through the chute gates into the gangway to keep the ore away from the back and provide room for the miners to work. When shrinkage stoping is completed, the broken ore remaining in the stope is all drawn off, and the stope is filled with waste rock or mill tailings. The crowns of the stopes and the pillars between them are later mined by the square-set timbering system, the square sets being filled with waste.

The ore drops from the chutes into ore cars pulled by compressed-air locomotives and is taken to the shafts for hoisting. Primary crushing of the ore is done at the shafts. From the shafts the ore is moved by a rail tramway to the South mill, which has a capacity of 3,900 tons per 24 hours. Here the ore is reduced further by stamps and fed to rod mills in closed circuit with Clark-Todd amalgamators for primary grinding and to ball mills and pebble mills in closed circuit with Clark-Todd amalgamators for secondary grinding. The copper amalgamation plates, for many years an integral part of the mill equipment, gradually are being replaced by the Clark-Todd amalgamators. Classification is done partly in the South mill and is finished in cyanide sand plant No. 1 and cyanide sand plant No. 3. In plant No. 3 part of the sand tailings from the South mill are classified and ground further in ball mills in closed circuit with Clark-Todd amalgamators. The sands are treated by cyanide leaching, and the slimes are thickened and sent to the slime plant at Deadwood for further treatment. In plant No. 1 a partly classified sand portion of the tailings from the South mill is separated by cone classification into sand and slime fractions. In this plant the sands are leached, and the solutions from both this plant and plant No. 3 are precipitated. Slimes are piped to the slime plant at Deadwood, which accomplishes cyanidation of the slimes from both plants. Precipitation is by the Merrill-Crowe process. Silver is parted from the gold in the company refinery, and virtually pure metals are shipped to the mint.

Digitized by Google

*Other mines.*—The Bald Mountain Mining Co. maintained production from its consolidated group of mines and 325-ton cyanide mill at Trojan continuously at capacity in 1938. The yield in recovered metals from 118,026 tons of ore treated in the mill and 123 tons of high-grade ore shipped to smelters was 23,899 fine ounces of gold and 34,012 fine ounces of silver, which together brought a net return of $851,245.33 after deductions for transportation and mint and smelter charges. The company paid $231,250 in dividends in 1938. Additions to the plant included intermediate grinding and accessory equipment for all ores and a 100-ton rotary hearth roasting furnace for sulfide ores. The ore treated in 1938 came from the Portland, Trojan, Foley, Dakota, and Clinton claims and was brought to the mill by rail tramway and trucks. The company did 13,260 feet of development work in the mine during the year.

Gold production of the Canyon Corporation from the refractory sulfide ores (commonly known as blue ores) of the Maitland group 5½ miles northwest of Deadwood increased in 1938 over 1937. Besides gold and silver, the ores contain pyrite, silica, dolomite, and some undetermined arsenic mineral. Treatment is by the roast-cyanidation process. The mill handled a daily average of 103 tons for 365 days in 1938. Mine development work done totaled 4,850 feet. The mine is opened by a 350-foot shaft and drifts and winzes.

Gilt Edge Mines, Inc., which began production from the Gilt Edge-Dakota Maid group in May 1937, continued operations throughout 1938 at an average rate in excess of 100 tons of ore daily. The mine is opened by a 150-foot vertical shaft and 3,100 feet of useful tunnels and drifts, of which 1,200 feet were driven in 1938. Most of the ore extracted was oxidized, and all was treated by the all-slime cyanide process in the company mill. During the year a jig and amalgam barrel were installed to recover free gold from the ball-mill circuit.

Gold, Inc., continued to do development work at the Minnesota group 4 miles northeast of Rochford on Gimlet Creek and treated ore intermittently in the mill at the mine. The equipment of the mill consists of 10 stamps, jaw crusher, rolls, ball mill, amalgamator, classifier, flotation machine, and table. Small lots of gold recovered by amalgamation were shipped to the Denver Mint. About 30 tons of concentrates produced were stored at the mill. Ore from the Belle Eldridge property was shipped to the Canyon Corporation mill early in 1938.

### PENNINGTON COUNTY

Empire Gold Mines, Inc., operated its Golden Slipper mine 5 miles east of Hill City continuously in 1938. The output was 12,000 tons of ore, which was treated in the company mill by ball-mill grinding, jig concentration, and plate amalgamation, followed by flotation of the tailings from the plates. The jig concentrates were amalgamated in a barrel. Gold valued at $82,388 was recovered by amalgamation and shipped to the Denver Mint during the year. The concentrates, containing gold valued at smelter payment at $23,770, were sold to the East Helena (Mont.) and Leadville (Colo.) smelters. The silver contained in both bullion and concentrates was valued at $350. The ore is hoisted through an incline shaft 550 feet deep. Development work done in the mine during the year totaled 3,500 feet. During December 1938 and January 1939 a cyanide unit was installed to

Digitized by Google

treat the flotation concentrates. The other four lode mines and prospects producing in Pennington County in 1938, all operated on a small scale, comprised the Burlington, from which a little gold was recovered by hand methods; Gold Lode, equipped with a 20-ton amalgamation mill; Murphy-Nelson property, equipped with a small jig and table; and Shellerud, equipped with a small stamp-amalgamation mill.

The Anchor Gold Mining Co., working placer ground on Gold Run and Cement Creeks in the summer of 1938 with a 1½-yard dragline excavator and a portable land dredge, handled 5,000 cubic yards of gravel from which were recovered 35.03 crude ounces of placer gold 0.975 fine. Owing to a shortage of water the equipment could not be run continuously, and the total operating time was only about 10 days. Individuals sluicing, drift mining, and panning on Battle, Castle, Rapid, Spring, and Slate Creeks continued to recover small lots of gold dust, most of which was sold to dealers or traded for groceries at stores in the vicinity.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN TEXAS

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 457 | Smelting and refining plants in Texas | 458 |
| Calculation of value of metal production | 457 | Mines review by counties | 459 |
| Mine production | 457 | | |
| Ore classification | 458 | | |

Virtually all the gold and lead and most of the copper produced in Texas in 1938 came from mines producing silver as the metal of chief value. Compared with 1937, the output of silver in 1938 increased 8 percent in quantity but decreased 10 percent in value owing to a drop of nearly 17 percent in the Government-fixed price of silver. The quantity and value of the other three metals, especially copper, decreased in 1938; however, their combined value was only $105,000 in 1937 and $49,965 in 1938 compared with $1,025,398 and $926,389, respectively, for silver alone. The Presidio mine of the American Metal Co. at Shafter, Presidio County, was the only large producer in the State in 1938. The output of the Plata Verde mine near Van Horn in Hudspeth County, a substantial producer of silver in 1936 and 1937, declined heavily in 1938.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

## MINE PRODUCTION

The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1934 to 1938, as well as the total metal production from 1885 to 1938.

Digitized by Google

*Mine production of gold, silver, copper, lead, and zinc in Texas, 1934–38, and total, 1885–1938, in terms of recovered metals*

| Year | Ore (short tons) | Gold | | Silver | |
|---|---|---|---|---|---|
| | | Fine ounces | Value | Fine ounces | Value |
| 1934 | 47,680 | 358.74 | $12,538 | 854,442 | $552,367 |
| 1935 | 72,222 | 518.00 | 18,130 | 1,000,960 | 719,440 |
| 1936 | 104,990 | 613.00 | 21,455 | 1,361,459 | 1,054,450 |
| 1937 | 120,145 | 562.00 | 19,670 | 1,325,660 | 1,025,398 |
| 1938 | 131,002 | 439.00 | 15,365 | 1,433,008 | 926,389 |
| 1885-1938 | (1) | 7,099.00 | 182,410 | 28,749,634 | 20,240,960 |

| Year | Copper | | Lead | | Zinc | | Total value |
|---|---|---|---|---|---|---|---|
| | Pounds | Value | Pounds | Value | Pounds | Value | |
| 1934 | 29,000 | $2,320 | 719,000 | $26,603 | ---------- | ---------- | $593,828 |
| 1935 | 28,000 | 2,324 | 1,043,000 | 41,720 | ---------- | ---------- | 781,614 |

## ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in Texas in 1938, with content in terms of recovered metals*

| Source | Mines producing | Ore | Gold | Silver | Copper | Lead |
|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* |
| Dry and siliceous silver ore | 3 | 130,923 | 438.47 | 1,431,696 | 25,674 | 682,560 |
| Copper ore | 3 | 70 | ---------- | 1,235 | 6,326 | ---------- |
| Lead ore | 2 | 9 | .53 | 77 | ---------- | 1,440 |
| | [1] 7 | 131,002 | 439.00 | 1,433,008 | 32,000 | 684,000 |
| Total, 1937 | 7 | 120,145 | 562.00 | 1,325,660 | 320,000 | 790,000 |

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

## SMELTING AND REFINING PLANTS IN TEXAS

Although silver is the only one of the five metals reviewed in this chapter of which Texas is a large producer, the State derives much benefit through its smelting and refining industries from silver and

Digitized by Google

other metals produced outside the State. Custom smelters of the American Smelting & Refining Co. in Texas furnished a market for ores and concentrates from eight Western States in 1938. The copper and lead plants at El Paso treated gold, silver, copper, and lead ores and concentrates from Arizona, California, Colorado, New Mexico, and Texas and lead ore in bond from Mexico. The natural-gas-retort zinc-smelting plant at Amarillo treated zinc concentrates from Arizona, Colorado, Idaho, Nevada, New Mexico, and Utah. The Illinois Zinc Co. horizontal-retort zinc smelter 5 miles northeast of Dumas was run on lead-free zinc concentrates from the Peru mill at Deming, N. Mex., and on other zinc concentrates received from operators in Washington and the Tri-State district of Oklahoma, Kansas, and Missouri.

The Nichols electrolytic copper refinery at El Paso continued in 1938 to treat copper anodes produced at the Arizona smelters of the Phelps Dodge Corporation. The plant is operated by the Nichols Copper Co., which since 1934 has been a unit of the Phelps Dodge Corporation. About 8,000 tons of anodes pass through the refinery monthly.

Natural gas is used for fuel by all the foregoing plants.

## MINES REVIEW BY COUNTIES

*Culberson County.*—Lessees working on the three upper levels of the Hazel mine, 16 miles northwest of Van Horn, from March 15 to December 31, 1938, shipped 373 tons of silver-copper ore to the El Paso smelter. The mine is developed by a vertical shaft 746 feet deep and about 5,000 feet of drifts, crosscuts, and raises. The drifts on each of the three upper levels are about 400 feet long. The lessees did 50 feet of sinking on a new shaft in 1938. A 5-ton lot of copper-silver ore was shipped from another property in Culberson County during the year.

*Hudspeth County.*—Siliceous silver ore containing some copper, shipped to the El Paso smelter from the Plata Verde mine 14 miles by road southwest of Van Horn, yielded most of the metal output of Hudspeth County in 1938. The mine was operated by the owners, Drunzer and Buchholtz, at a reduced tonnage rate after the lessees relinquished it on January 15. A lessee at the Black Shaft mine in the Allamoore district shipped 54 tons of copper-silver ore to the El Paso smelter early in the year. A small lot of lead-silver ore was shipped to the smelter from each of two properties near Sierra Blanca.

*Presidio County.*—The American Metal Co. of Texas operated its Presidio silver mine at Shafter continuously in 1938. The mine is developed by two vertical shafts, one 400 feet and one 700 feet deep; two underground subshafts, one 100 feet and one 200 feet deep; and eight levels with stopes, raises, and other openings totaling more than 50 miles of underground workings. Development work in 1938 totaled 9,036 feet, of which 6,747 feet were prospecting, and diamond drilling totaled 30,127 feet. The ore is found as a replacement of limestone beds and is oxidized, the principal mineral being silver chloride associated with argentite, cerargyrite, galena, anglesite, and cerussite. A rail tramway runs from the west shaft to the east shaft, which is connected by aerial tramway with the company 350-ton gravity concentration-cyanidation mill at Shafter, 1 mile away. The

Digitized by Google

ore is crushed to one-quarter inch size and then slimed to 65 percent minus 200-mesh in ball mills, grinding in cyanide solution. Minus 6-mesh material is screened out before grinding and tabled for lead-silver concentrates. Part of the ball-mill circulating load is also passed over tables. The pulp is agitated in Pachuca tanks, and then it passes through a series of thickeners for washing and decantation. The last thickener underflow is filtered before going to waste. The silver-bearing solutions are clarified and precipitated, using zinc dust. In 1938 the mill produced 685 tons of table concentrates averaging 0.079 ounce of gold and 405.82 ounces of silver to the ton and 49.95 percent lead. The concentrates and precipitates were shipped to the Carteret (N. J.) smelter. Electric power for the mine and mill is obtained from a 1,200-horsepower Diesel plant.

*Production of silver from the Presidio mine,*[1] *1885–1938* [2]

| Period | Mill heads treated (short tons) | Silver content of mill heads (ounces) | | Recovery of silver | |

(MINE REPORT)

By T. H. Miller and Paul Luff

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 461 | Metallurgic industry | 465 |
| Calculation of value of metal production | 461 | Review by counties and districts | 469 |
| Mine production by counties | 464 | Tintic district | 471 |
| Mining industry | 465 | Bingham or West Mountain district | 473 |
| Ore classification | 465 | Park City region | 475 |

The value of the metal production in Utah in 1938 was $43,745,902, or slightly less than half the value of the 1937 output. The pronounced recession was caused by lower average metal prices combined with curtailed output of copper ore at Bingham and zinc-lead ore at Park City. There were decreases in all five metals, especially copper which declined from a record output of 411,988,000 pounds in 1937 to 216,252,000 pounds in 1938; the total value of the copper dropped 57 percent.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |

[2] Short tons.

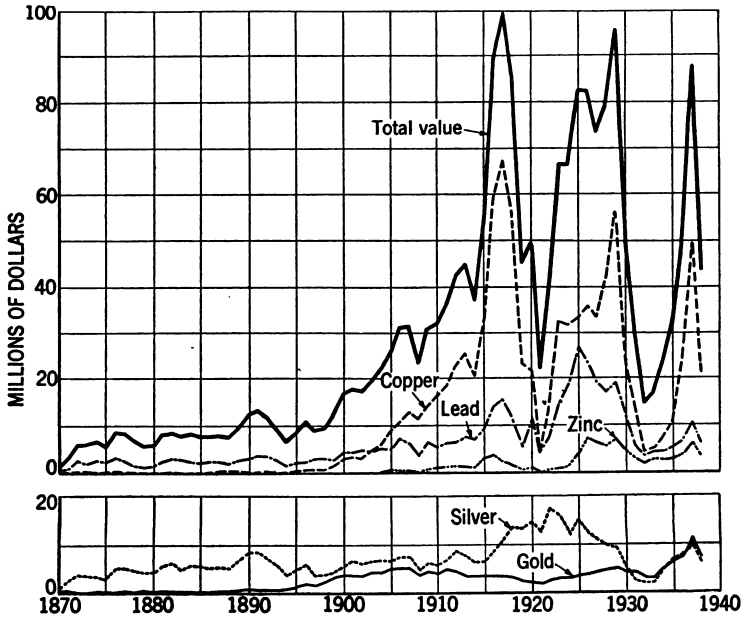

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Utah, 1870–1938.

*Gold.*—The output of gold in Utah fell 122,129 ounces in 1938; gold from copper ore declined more than 104,000 ounces as a result of curtailment by the Utah Copper Co., and there were also decreases in gold from all other classes of ore. Copper ore yielded 49 percent

Digitized by Google

of the total, siliceous ore 35 percent, and zinc-lead ore 13 percent; ore of all classes treated at concentration mills yielded 62 percent, crude ore smelted nearly 30 percent, and ore to amalgamation and cyanidation mills 8 percent. Mines in the West Mountain district produced 64 percent of the total gold, despite a decrease of 110,759 ounces in the district output. The Utah Copper Co. was, as usual, the largest gold producer in Utah, followed by the United States & Lark, Con Mercur, Mammoth, and Eureka Standard mines; these five mines yielded nearly 74 percent of the total gold.

*Silver.*—The output of silver in Utah in 1938 was 3,186,385 ounces less than in 1937. Production from the Bingham district decreased 1,201,685 ounces, chiefly as a result of curtailment by the Utah Copper Co.; and that from Park City declined 1,169,976 ounces, as increases at the Park City Consolidated and Park Galena properties were more than offset by large decreases caused by the closing of the Silver King Coalition and Park Utah Consolidated properties. The yield of silver from the Tintic district was 520,792 ounces less than in 1937, due to decreases at nearly all the large producers in the district. Zinc-lead ore yielded 47 percent of the total silver from Utah, siliceous ore nearly 32 percent, lead ore 12 percent, and copper ore 9 percent. Nearly 57 percent of the total came from ore milled and 43 percent from crude ore smelted. The United States & Lark mine at Bingham was again the largest silver producer in Utah, followed by the Tintic Standard, Park City Consolidated, Utah Copper, and Silver King Coalition properties; these five properties produced nearly 70 percent of the total silver.

*Copper.*—Suspension of operations by the Utah Copper Co. for 6 weeks during June and July 1938 and curtailment in the rate of operations for the rest of the year caused a decrease in output of copper ore by the company from 23,119,800 tons in 1937 to 11,704,900 tons in 1938. As a result, recoverable copper produced in Utah declined from 411,988,000 to 216,252,000 pounds. An increase in copper production was reported by the Ohio Copper Co. due to full-year operation of the mill completed late in 1937. Copper ore and mine-water precipitates yielded nearly 96 percent of the total copper, and most of the remainder came from zinc-lead ore milled and siliceous ore smelted.

*Lead.*—The output of recoverable lead in Utah fell from 178,916,000 pounds in 1937 to 131,314,000 pounds in 1938. Most of the decrease was in zinc-lead ore from Park City, due to the closing of the Silver King Coalition and Park Utah Consolidated properties, but there were also decreases in the Bingham, Tintic, Ophir, and Rush Valley districts. Zinc-lead ore yielded 72 percent of the total, lead ore 21 percent, and siliceous ore 6 percent; ore milled and smelted yielded 73 percent of total and ore smelted direct 27 percent. The United States & Lark mine at Bingham was, as usual, the largest producer of lead in Utah, followed by the Tintic Standard, Silver King Coalition, Boston Consolidated, and West Calumet properties; these five mines produced 74 percent of the State total.

*Zinc.*—The output of recoverable zinc in Utah decreased 28,686,000 pounds in 1938. Production from Park City declined more than 27,300,000 pounds and that from Tooele County also decreased, but output from the Bingham district increased slightly. Zinc ore and

Digitized by Google

zinc-lead ore shipped crude to smelters yielded 96,079 pounds of recoverable zinc, and the remainder of the zinc came from complex zinc-lead-iron ore treated in four flotation plants. The United States & Lark, Silver King Coalition, West Calumet, Hidden Treasure, and Park City Consolidated mines were the leading zinc producers in Utah in 1938; these five mines produced 84 percent of the total zinc.

## MINE PRODUCTION BY COUNTIES

## MINING INDUSTRY

Curtailment by the Utah Copper Co. at Bingham and closing of the Silver King Coalition and Park Utah Consolidated properties at Park City resulted in marked decreases in the output of copper, lead, and zinc in Utah in 1938; the output of gold and silver also decreased as the larger part of the gold and silver from Utah comes from copper ore and zinc-lead ore. Most of the decrease was in the Bingham and Park City areas, but output in the Tintic, Ophir, and Rush Valley districts also decreased. There was an important increase in output of gold ore at Mercur.

Work of driving the Elton tunnel from Tooele to the Apex-Delaware group in the Bingham district was continued during 1938 by National Tunnel & Mines Co.; the adit was about one-fourth completed at the end of the year. The Bingham-Copperfield vehicular tunnel was completed by the Utah Copper Co. and placed in operation early in 1939. Other mine development and plant improvements of importance included the Thaynes shaft work by the Silver King Coalition Mines Co., enlargement of the Geyser Marion cyanide mill at Mercur, and erection of a 600-ton flotation plant at the Ophir Hill tailings dump.

### ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in Utah in 1938, with content in terms of recovered metals*

| Source | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Dry and siliceous gold ore | 50 | 283,472 | 41,381 | 326,711 | 708,936 | 1,019,338 | ---------- |
| Dry and siliceous gold-silver ore | 20 | 184,346 | 24,620 | 1,050,385 | 2,682,675 | 3,049,967 | ---------- |
| Dry and siliceous silver ore | 29 | 92,543 | 4,265 | 1,698,153 | 861,575 | 4,409,627 | ---------- |
| | 99 | 560,361 | 70,266 | 3,075,249 | 4,253,186 | 8,478,932 | ---------- |
| Copper ore | 14 | 12,032,385 | 98,100 | 919,224 | [1] 207,014,357 | 6,285 | ---------- |
| Lead ore | 79 | 94,883 | 5,314 | 1,112,585 | 735,328 | 27,697,916 | ---------- |
| Zinc ore | 1 | 83 | ---------- | ---------- | ---------- | 3,160 | 40,979 |
| Zinc-lead ore | 31 | 560,948 | 26,802 | 4,575,668 | 4,249,129 | 95,127,707 | 67,275,021 |
| Total, lode mines | [2] 183 | 13,248,660 | 200,482 | 9,682,726 | [1] 216,252,000 | 131,314,000 | 67,316,000 |
| Total, placers | 22 | ---------- | 148 | 6 | ---------- | ---------- | ---------- |
| | 205 | 13,248,660 | 200,630 | 9,682,732 | [1] 216,252,000 | 131,314,000 | 67,316,000 |
| Total, 1937 | 203 | 24,578,275 | 322,759 | 12,869,117 | [3] 411,988,000 | 178,916,000 | 96,002,000 |

[1] Includes 10,220,878 pounds recovered from precipitates.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 4,839,088 pounds recovered from precipitates.

## METALLURGIC INDUSTRY

The 13,248,660 tons of ore produced in Utah in 1938 comprised 197,936 tons of ore treated at amalgamation and cyanidation mills (an increase from 127,288 tons in 1937), 12,597,042 tons treated at concentration plants (a marked decrease from 23,941,803 tons in 1937), and 453,682 tons shipped crude to smelters (compared with 509,184 tons in 1937).

Digitized by Google

Four gold and silver mills were operated in Utah in 1938. One small straight amalgamation mill in Box Elder County and one combined amalgamation and concentration plant in Piute County treated 7,624 tons of ore. Two cyanidation mills at Mercur, Tooele County—one of them also equipped for flotation concentration—treated 190,312 tons of ore; the ore treated at these cyanidation plants contained (gross assay) 21,464 ounces of gold and 1,110 ounces of silver, indicating recoveries (in bullion and concentrates) of nearly 74 percent of the gold and 61 percent of the silver. The plants used 87,266 pounds of sodium cyanide (91-percent grade), 38,106 pounds of zinc dust, and 646,330 pounds of lime.

Eight concentration plants (all straight flotation) were operated in Utah in 1938. Three plants (Magna, Arthur, and Ohio Copper) treated 12,031,615 tons of copper ore and old tailings, one (Ophir) treated 4,596 tons of lead tailings, and four (Bauer, Midvale, Tooele, and Silver King) treated 560,831 tons of zinc-lead ore.

The following tables give details of treatment for all the ore produced in Utah in 1938.

*Mine production of metals in Utah in 1938, by methods of recovery, in terms of recovered metals*

| Method of recovery | Meterial treated | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|
| | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Ore amalgamated | 7,624 | 381 | 250 | | | |
| Ore cyanided | 190,312 | 14,391 | 634 | | | |
| Concentrates smelted [1] | 546,903 | 126,526 | 5,504,390 | 200,941,529 | 95,229,226 | 67,219,921 |
| Ore smelted | 453,682 | 59,184 | 4,177,452 | 5,089,593 | 36,084,774 | 96,079 |
| Mine-water precipitates smelted [2] | 6,607 | | | 10,220,878 | | |
| Placer | | 148 | 6 | | | |
| Total, 1937 | | 200,630 | 9,682,732 | 216,252,000 | 131,314,000 | 67,316,000 |
| | | 322,759 | 12,869,117 | 411,988,000 | 178,916,000 | 96,002,000 |

[1] Includes zinc concentrates treated at electrolytic plants.
[2] All from Salt Lake County.

*Mine production of metals from amalgamation and cyanidation mills (with or without concentration equipment) in Utah in 1938, by types of mills and by counties, in terms of recovered metals*

AMALGAMATION MILLS

### BEAVER COUNTY

Lessees continued operations at the Horn Silver mine at Frisco during 1938 and shipped 4,811 tons of ore, chiefly gold-silver ore for smelting; no new development was under way, but the Horn Silver Mines Co. reconditioned and reopened the shaft to the 500-foot level. The remainder of the output from Beaver County comprised small lots of zinc-lead ore shipped to the custom mill at Midvale from the Lincoln, Horn Silver, and Moscow mines and ore shipped for smelting from several properties, including the O. K., Honey Boy, Sheep Rock, Revenue, Frisco Silver-Lead, Quad Metals, Cactus, Good Luck, Beaver Crown, Moscow, Atlas, and Silver Draw.

### BOX ELDER COUNTY

The output of silver from Box Elder County decreased markedly in 1938, as lessees at the Vipont mine in the Ashbrook district suspended shipments of silver ore; only 30 tons were shipped compared with more than 1,000 tons in 1937. The remainder of the county output comprised silver ore from the Apex and Liberty Bell (Skoro), Utah-Idaho, and Gold Lead mines; lead ore from the Comstock mine near Lucin; and gold ore from the Raft River and Susannah properties. A small amalgamation plant was operated at the Susannah property for a short time.

### IRON COUNTY

The value of the metal output from mines in Iron County in 1938 was less than half that in 1937. The entire output was dry and siliceous ore shipped for smelting; it comprised gold ore from the Creole, Gold Hill, Raindrop, Wonder, Surprise, Genter, and Pipe Dream mines and silver ore from the Ophir property.

### JUAB COUNTY

*Tintic district.*—The Tintic district lies in both Juab and Utah Counties, and the mines in both sections are reviewed here. The table that follows gives the metal production in each section in 1938, a comparison of the total with that for 1937, and the total output of the district from 1869 to 1938. The table indicates a decrease in the output of all five metals, mostly at mines in the eastern (Utah County) section.

*Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah Counties, Utah, 1937–38, and total, 1869–1938, in terms of recovered metals*

| | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc | Total value |

The Chief Consolidated Mining Co. continued operations in 1938 at the Chief No. 1, Gemini, Eureka Hill, and Plutus mines in Juab County and the Apex Standard mine in Utah County. According to the company printed annual report the output from Juab County comprised 1,464 tons of lead ore, 13,188 tons of silver ore, and 3,827 tons of zinc-lead ore from the Chief No. 1 mine; 4,083 tons of silver ore from the Gemini mine; 2,090 tons of silver ore from the Eureka Hill mine; and 308 tons of lead ore and 2,158 tons of silver ore from the Plutus mine. Total metal production from all mines was given as follows: Gold, 1,575 ounces; silver, 307,696 ounces; copper, 106,233 pounds; lead, 1,278,101 pounds; and zinc, 816,749 pounds. The company reported 3,099 feet of development in the Chief No. 1 mine and 2,564 feet in the Plutus mine. The Centennial-Beck, Victoria, and Eagle & Blue Bell properties were operated continuously by the United States Smelting, Refining & Mining Co.; all the output was crude ore shipped for smelting and comprised about 43,800 tons of gold-silver ore and about 2,900 tons of lead ore, approximately the same as was produced in 1937. The Mammoth Mining Co. operated its property the entire year and produced nearly 40,000 tons of ore (chiefly gold-silver ore) shipped for smelting, a decrease of about 9,000 tons from the 1937 output; development of about 1,100 feet was reported, and dividends totaling $39,532 were paid. The American Smelting & Refining Co. reconditioned the Grand Central mine during 1937 and in 1938 operated from January until the end of August, producing highly siliceous gold-silver ore used as converter flux at the Garfield smelter; company and lessee production totaled more than 28,000 tons of ore, a marked increase over the 1937 output. The remainder of the output from the Juab County section of the Tintic district was crude ore shipped for smelting from the Godiva (3,144 tons of gold ore), Dragon & Martha Washington, Empire Star, Showers, Black Jack, and other properties.

Producing mines in the Utah County section of the Tintic district in 1938 included the Apex Standard, Colorado, Eureka Lilly, Eureka Standard, May Day, North Lily, Tintic Bullion, Tintic Standard, Yankee, and Zuma properties. The Tintic Standard Mining Co. reported an increase in output at the Tintic Standard and Colorado mines, but decreases were reported at the Eureka Standard and Eureka Lilly mines. The following details of shipments by mines and classes of ore were reported in the company printed annual report: Tintic Standard mines, 26,429 tons of lead ore and 57,137 tons of siliceous ore; Eureka Standard mine, 19,659 tons of siliceous ore and 6,252 tons of zinc-lead ore; Eureka Lilly mine, 2,102 tons of siliceous ore and 971 tons of lead ore; and Colorado Consolidated mine, 2,964 tons of siliceous ore. About 11,500 feet of development were reported, chiefly in the Tintic Standard and Eureka Standard mines, and dividends amounting to $342,027 were paid. Development at the Eureka Standard mine opened a body of zinc-lead ore in the Ophir limestone, from which shipments were first made in 1938; prior to this important discovery the entire output of the mine was siliceous gold ore from fissure veins in quartzite. The Tintic Standard mine ranked second in output of silver and lead in Utah in 1938. The North Lily Mining Co. operated the North Lily and Tintic Bullion mines the entire year; each mine produced gold-silver ore and lead ore shipped for smelting and zinc-lead ore sent to the flotation mill at Tooele. The output

Digitized by Google

from the Tintic Bullion mine increased markedly. The remainder of the output from the Utah County section of the Tintic district was ore of smelting grade from the Apex Standard, May Day (Mountain View), Yankee, and Zuma mines and a car of old tailings from the Harold dump of the Standard Reduction Co.

Production from outlying districts in Juab County in 1938 comprised gold ore from the Ibex mine in the Detroit district; rich silver-lead ore from the Emma, Galena, Utah & Last Chance, and Carnation mines at Fish Springs; siliceous ore from the Gold Bond and Premier mines near Spring Creek; and lead ore from the Scotia group in the West Tintic district.

### PIUTE COUNTY

The value of the metal output from Piute County dropped more than $110,000 in 1938 due to decreased output of gold ore from the Annie Laurie mine in the Gold Mountain district. The property was operated intermittently by Allied Annie Laurie Gold Mines, Inc., but the ore milled declined from about 20,000 tons in 1937 to 7,574 tons in 1938. Siliceous ore was shipped for smelting from the General Connor and Antler mines in the Gold Mountain district. The Deer Trail mine was closed during part of 1938; lessees shipped 1,451 tons of gold ore for smelting, a decrease from 2,140 tons in 1937. Ore was shipped for smelting from several mines in the Ohio district, including the Gold Strike, Tushar, Bully Boy, Wedge, Desert, Great Western, and Yellow Congo properties.

### SALT LAKE COUNTY

Production from the Big Cottonwood district decreased sharply in 1938, as lessees' output from the Cardiff mine was much less than in 1937; other producers were the Wasatch Gold Mines, Inc., Prince of Wales, and Tar Baby properties. In the Little Cottonwood district the Alta United, Columbus, Columbus Rexall, Dipper, and Michigan Utah properties were productive.

*Bingham or West Mountain district.*—The Bingham district is by far the most important mineral-producing area in Utah, and in 1938 its mines yielded metals valued at $33,707,918, or 77 percent of the State total; the value of the district output, however, decreased 51 percent from that in 1937. The quantity of copper decreased 48 percent, gold 46 percent, silver 25 percent, and lead 9 percent, but zinc increased 12 percent. The following table gives the production from mines at Bingham in 1937 and 1938 and the total from 1865 to 1938.

*Mine production of gold, silver, copper, lead, and zinc in Bingham or West Mountain district, Salt Lake County, Utah, 1937–38, and total, 1865–1938, in terms of recovered metals*

| Year | Mines producing | Ore | Gold (lode and placer) | Silver (lode and placer) | Copper | Lead | Zinc | Total value |
|---|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* | |
| 1937 | 15 | 23,720,375 | 240,147 | 4,873,479 | 406,842,000 | 90,466,000 | 41,139,200 | $69,414,205 |
| 1938 | 14 | 12,507,863 | 129,388 | 3,671,794 | 212,098,500 | 82,668,239 | 46,192,937 | 33,707,918 |
| Total, 1865–1938 | | [1] | 3,748,697 | 108,258,105 | [2] 2,764,853 | [2] 1,311,151 | [2] 329,077 | 1,164,623,948 |

[1] Figures not available. [2] Short tons.

Digitized by Google

Most of the decrease in gold, silver, and copper from the Bingham district in 1938 was caused by curtailment by the Utah Copper Co.; the open-cut mine and the Magna and Arthur mills operated at a curtailed rate from January until June 15, when all production was suspended. Operations were resumed August 1 and continued at a reduced rate for the remainder of the year. The company mined and milled 11,704,900 tons of ore in 1938 compared with 23,119,800 tons in 1937, and there were similar decreases in output of copper, gold, silver, and molybdenum. The new vehicular tunnel connecting Bingham and Copperfield was completed and placed in operation in February 1939. The 7,000-foot bore constructed by the Utah Copper Co. at a cost of about $1,400,000 will be used to divert vehicular and pedestrian traffic around the pit, closing the road crossing the pit and allowing bench mining to be started on that side. The American Smelting & Refining Co. operated the Boston Consolidated property of the Utah Copper Co. the entire year; the output comprised about 44,500 tons of smelting ore (gold-silver ore and lead ore) and about 700 tons of zinc-lead ore sent to Midvale for milling.

The United States Smelting, Refining & Mining Co. operated the entire year at the United States & Lark, Niagara, Bingham Metals, and Montana-Bingham properties at Bingham. The output of gold, silver, and lead decreased slightly compared with 1937, but the output of zinc increased considerably owing to higher average content of the ore treated at the Midvale mill. Most of the production was zinc-lead ore from the United States & Lark mine; the property ranked first in output of silver, lead, and zinc in Utah in 1938 and second in gold and copper.

The Ohio Copper Co. operated the new 1,000-ton flotation plant the entire year and treated 326,715 tons of old tailings from former milling operations. According to the company printed annual report, production in 1938 totaled 1,250,730 pounds of copper, 249 ounces of gold, and 3,116 ounces of silver. About 92 percent of the copper came from old tailings milled and the remainder from underground leaching operations on the Mascotte tunnel level.

The Apex-Delaware group was operated by National Tunnel & Mines Co. the entire year; part of the output was by lessees and part on company account. Nearly 40,000 tons of ore were produced, comprising gold ore and lead ore shipped for smelting and zinc-lead ore sent to the flotation mill near Tooele. Work of driving the Elton tunnel was seriously handicapped by a heavy flow of water in the unconsolidated gravel formation, but early in 1939 the bedrock limestone was entered and greater progress was reported; at the end of 1938 the tunnel was in about 6,200 feet of the projected 23,000 feet.

The Combined Metals Reduction Co. operated the Park-Bingham (Lavagnino) group in Butterfield Canyon the entire year, producing 6,770 tons of gold ore and 390 tons of lead ore shipped for smelting and 14,320 tons of zinc-lead ore shipped to the flotation plant at Bauer.

The remainder of the output from the West Mountain district in 1938 included a little zinc-lead ore from the Utah Metal & Tunnel property and a little copper ore from the Bingham Congor mine.

## SUMMIT AND WASATCH COUNTIES

### PARK CITY REGION

The value of the metal output from mines in the Park City region in 1938 was about one-third that in 1937; the marked decrease was due chiefly to the closing of the Silver King Coalition property early in the year. The following table compares the production from the Park City region in 1937 and 1938 and shows the total for the period 1870 to 1938.

*Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1937–38, and total, 1870–1938, in terms of recovered metals*

| Year | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc | Total value |
|---|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* | |
| 1937 | 11 | 286,128 | 7,033 | 3,132,552 | 845,215 | 44,833,712 | 38,683,200 | $7,931,052 |
| 1938 | 12 | 149,113 | 5,678 | 1,962,576 | 530,041 | 14,515,652 | 11,356,855 | 2,732,259 |
| Total, 1870–1938 | -------- | (1) | 429,790 | 217,834,168 | 59,699,840 | 2,186,999,307 | 499,397,045 | 317,903,566 |

[1] Figures not available.

Mining and milling at the Silver King Coalition Mines Co. were suspended April 30, 1938, and the property remained idle until May 1939. According to the company printed annual report production during the first 4 months of 1938 amounted to 35,919 tons of silver-lead-zinc milling ore and 97 tons of rich silver-lead ore of smelting grade; the output of silver, lead, and zinc was about one-fourth that in 1937. Shaft sinking at the new Thaynes shaft continued throughout the year, and at the end of the year the shaft was down 1,379 feet (a total of 907 feet of sinking in 1938); a connection was made on the 900 level of the Silver Hill section. Development at the Silver King property amounted to 9,080 feet. One quarterly dividend of $122,047 was paid April 1, 1938.

Operations at the properties of the Park Utah Consolidated Mines Co. in 1938 were reduced to a one-shift basis January 8 and were completely suspended May 5. As a result, production decreased to 19,144 tons in 1938 from 93,014 tons in 1937. Most of the output was zinc-lead ore shipped to the mill at Tooele from the Judge unit in Wasatch County and the Daly West and Judge properties in Summit County; ore of smelting grade was shipped from the Daly and Ontario properties in Summit County.

According to the printed annual report of the Park City Consolidated Mines Co. the output of silver-zinc-lead ore was 74,650 tons in 1938, an increase from 38,464 tons in 1937; a total of about 6,280 feet of development was done in 1938. The ore was shipped to the flotation plant at Midvale for treatment, and a substantial increase was recorded in output of silver; the property was the third-largest silver producer in Utah in 1938.

The New Park Mining Co., controlled by the Callahan Zinc-Lead Co., operated the entire year at the Park Galena property and shipped

Digitized by Google

15,969 tons of zinc-lead ore to the mill at Midvale; development at the mine amounted to 1,861 feet, and arrangements were made to reopen the Mayflower tunnel and extend it about 1,600 feet to open the Park Galena fissure at a depth of 760 feet below the present main tunnel.

The remainder of the output from the Park City region in 1938 comprised small lots of ore from the New Quincy, Keystone, and Park Flag properties and old tailings from Silver Creek.

### TOOELE COUNTY

*Camp Floyd (Mercur) district.*—The output of gold from Mercur increased from 14,016 ounces in 1937 to 23,001 ounces in 1938, as a result of increased output by both Snyder Mines, Inc., and Geyser Marion Gold Mining Co. Snyder Mines, Inc., operated the remodeled Manning mill from January to October and treated more than 85,000 tons of ore from the Con Mercur property by combined cyanidation and flotation; in addition, the company and lessees shipped 21,150 tons of gold ore for smelting. The Con Mercur mine was the third-largest producer of gold in Utah in 1938. The mill also treated by straight cyanidation about 5,100 tons of oxidized custom ore from five properties in the district. The Geyser Marion Gold Mining Co. completed the installation of new crushing, leaching, and precipitation equipment at the Sacramento and Geyser Marion properties, increasing the capacity of the two plants to about 800 tons of ore a day. The mills handled 65,251 tons of low-grade gold ore from the Geyser Marion open-cut mine and 34,529 tons of custom ore, including 27,157 tons from the Sacramento mine; the ore was treated by straight cyanidation. Other producers in the Camp Floyd district in 1938 included the Golden Gate, Herschel, Boston Sunshine, West Dip, McCornick, Rover, and Silver Lode properties; most of the output from these mines was treated at the two custom mills, but in addition gold ore was shipped crude for smelting from the West Dip and Boston Sunshine mines.

*Clifton (Gold Hill) district.*—Crude ore was shipped for smelting in 1938 from several mines in the Gold Hill district, including the Clifton Standard, Garrison, Gold Spar, Midas, New Baltimore, Rube No. 3, and Success.

*Ophir and Rush Valley districts.*—The value of the metal output from the Stockton-Ophir region decreased more than $1,160,000 in 1938, owing to decreases at the Hidden Treasure mine and at the properties operated by the Combined Metals Reduction Co. The Hidden Treasure property near Ophir was sold during the year to the United States Smelting, Refining & Mining Co.; production was suspended in July and was not resumed until early in 1939 after completion of an extensive reconditioning and development program. The output in 1938 was 13,742 tons of zinc-lead ore shipped to Midvale for milling, a decrease from 27,702 tons in 1937. The Ophir Development Co. continued work at the Ophir Hill mine, shipping 2,112 tons of zinc-lead ore to the mill at Tooele and 218 tons of lead ore for smelting. The International Smelting & Refining Co. completed the erection of a 600-ton flotation plant at the Ophir Hill tailings dump and placed the plant in operation November 21; about 5,000 tons of tailings were treated by the end of the year, and copper-lead concen-

Digitized by Google

trates were shipped to Tooele for smelting. Much of the equipment used in the construction of the mill was salvaged from the old Utah-Apex mill at Bingham, which was dismantled during 1938.

The Combined Metals Reduction Co. curtailed operations at the Cyclone (Bluestone), Honerine, and West Calumet mines in 1938, and the output of lead ore and zinc-lead ore was much less than in 1937; the output from the Cyclone mine decreased from about 15,000 to 8,429 tons and lead ore and zinc-lead ore from the Honerine and West Calumet mines from more than 42,000 to about 32,600 tons. The lead ore from all three properties was shipped to Tooele for smelting, and the zinc-lead ore was milled in the flotation plant at Bauer. Other producers in the Stockton-Ophir region included the Kearsarge, Lakes of Killarney, Tintic Ophir, Ophir, Zella, Mono, Commodore, Circle, and Hercules mines.

Other producing mines in Tooele County in 1938 included the Benmore property in the Columbia district; the Humdinger (Lead Ore) mine in the Free Coinage district; the Georgia Lyn, Monarch, and Lone Star mines at Lakeside; the Scranton mine in the North Tintic district; the Silver Island mine north of Wendover; the Combination mine in Pine Canyon in the West Mountain district; and the Eagle's Nest, Oro Del Rey, Liberty, Depression, and Imperial mines in the Willow Springs district.

### UTAH COUNTY

*American Fork district.*—The value of the metal output from the American Fork district decreased $91,205 in 1938, as the output from the Live Yankee mine declined. The property is owned by the American Smelting & Refining Co., and lessees' shipments of gold ore and zinc-lead ore declined from about 4,300 to 877 tons. Other producers in the American Fork district in 1938 included the Blue Rock (Pacific), Dutchman, and Bog Iron mines.

*Tintic district.*—The mines in the Utah County section of the Tintic district are reviewed under Juab County.

### WASHINGTON COUNTY

The Dixie (Apex) mine in the Tutsagubet district, operated by the Utah Southern Mining Co., was the only producer in Washington County in 1938; the company shipped 147 tons of copper ore to Garfield for smelting.

# GOLD, SILVER, COPPER, LEAD, AND ZINC IN WASHINGTON

(MINE REPORT)

By T. H. Miller and Paul Luff

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 479 | Metallurgic industry | 483 |
| Calculation of value of metal production | 479 | Review by counties and districts | 487 |
| Mine production by counties | 482 | Chelan district | 489 |
| Mining industry | 482 | Republic district | 489 |
| Ore classification | 483 | Metaline district | 491 |

The total value of the gold, silver, copper, lead, and zinc recovered from Washington ores and gravels in 1938 was $5,510,440, or more than double the value of the 1937 output ($2,253,054), and was the largest in the history of mining in the State. Substantial increases were recorded in the output of all five metals, especially gold and copper. Of outstanding interest was the starting in April of the new mill at the Holden property in Chelan County by the Howe Sound Co. The company mined and milled 371,800 tons of ore and was the largest producer of gold, silver, and copper in Washington in 1938. The output of gold from Ferry and Stevens Counties increased considerably, owing chiefly to regular operation of cyanide mills at Republic and Orient. Lead and zinc production from Pend Oreille County increased owing to a larger output of zinc-lead ore from two mines near Metaline Falls.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

| 1860–1938 | [2] 19,768 | 6,057,509 | [2] 43,100 | 5,456,646 | [2] 40,277 | 4,238,810 | 58,478,555 |

[1] 1860–1903: Figures not available; 1904–38: 3,634,402 tons produced. [2] Short tons.

*Gold and silver produced at placer mines in Washington, 1934–38, in terms of recovered metals*

| Year | Gold | | Silver | | Total value |
|---|---|---|---|---|---|
| | Fine ounces | Value | Fine ounces | Value | |
| 1934 | 1,773.45 | $61,982 | 317 | $205 | $62,187 |
| 1935 | 1,547.60 | 54,166 | 263 | 189 | 54,355 |
| 1936 | 657.20 | 23,002 | 133 | 103 | 23,105 |
| 1937 | 371.00 | 12,985 | 48 | 37 | 13,022 |
| 1938 | 1,575.00 | 55,125 | 218 | 141 | 55,266 |

*Gold.*—The output of gold in Washington increased from 36,310 fine ounces in 1937 to 74,175 ounces in 1938. Most of the gain was in Chelan County and was due to the starting of milling operations by the Howe Sound Co. The company treated 371,800 tons of gold-copper-silver ore in 1938 and was by far the largest gold producer in the State. Gold production from Ferry County increased 7,534 ounces owing to continuous operation of the Knob Hill cyanide plant and increased shipments of smelting ore from other mines at Republic. The gold output of Stevens County increased 1,763 ounces; most of it came from the First Thought cyanidation mill near Orient. Gold production from Whatcom and Okanogan Counties decreased. Gold ore treated at gold and silver mills increased to 212,161 tons in 1938, from 142,790 tons in 1937, and yielded 40 percent of the total gold produced; gold ore smelted (56,896 tons) yielded 16 percent; and copper ore concentrated (373,000 tons) yielded 41 percent. Most of the gold ore shipped for smelting came from the Aurum, Mountain Lion, Republic, and Quilp mines in the Republic district, Ferry County, but nearly 11,000 tons of low-grade gold ore from a property near Wenatchee, Chelan County, was shipped as siliceous flux to the smelter at

Digitized by Google

Tacoma. No large placer operations were reported in Washington in 1938, but gold output from placers increased to 1,575 ounces, most of which came from operations along the Columbia River, chiefly in Stevens and Ferry Counties on ground that will later be submerged under Grand Coulee Reservoir.

*Silver.*—The output of recoverable silver in Washington in 1938 was three times that in 1937. Nearly half of the increase was from copper ore (chiefly from Chelan County), but substantial increases also came from silver ore (chiefly from the Arlington mine in Okanogan County) and from gold ore from mines at Republic. The Chelan Division of the Howe Sound Co. was the largest silver producer in Washington in 1938, followed by the Arlington mine near Okanogan and the Knob Hill, Aurum, and Quilp mines at Republic; other important producers were the Silver Queen (Ark Mines Co.) mine at Kettle Falls and the Josephine mine near Metaline Falls. Gold ore and copper ore each yielded 33 percent of the total silver produced, and silver ore yielded 29 percent; ore concentrated yielded 65 percent, ore smelted nearly 20 percent, and ore to gold and silver mills 15 percent.

*Copper.*—The output of recoverable copper in Washington in 1938 was by far the largest in the history of the State and came chiefly from the Holden mine, operated by the Chelan Division of the Howe Sound Co. Most of the small remainder of the copper produced in the State came from three mines in Okanogan and Snohomish Counties. No production was reported from the Royal mine north of Leavenworth, Chelan County. The new flotation plant of the Holden property was placed in operation in April 1938. The capacity of the mill was increased during the summer and fall, and by the end of the year the mill was treating 2,000 tons of copper-gold-silver ore a day. Copper concentrates rich in gold and silver were shipped to Tacoma for smelting.

*Lead and zinc.*—The output of recoverable lead and zinc in Washington increased markedly in 1938 owing to an increase of more than 143,000 tons in the output of zinc-lead ore from two mines near Metaline Falls. All the zinc and nearly 94 percent of the lead produced in Washington came from the properties of the Pend Oreille Mines & Metals Co. and the Metaline Mining & Leasing Co. near Metaline Falls; most of the remainder of the lead output came from properties near Northport, Stevens County.

## MINING INDUSTRY

Metal mining in Washington was more active in 1938 than in any year of its history. The total value of the output was much larger than in any previous year, and new records were established in output of gold, copper, and zinc; output of lead very nearly attained the previous record. Such gains are entirely the result of large capital expenditures during 1936, 1937, and 1938, and the most important of these is the Holden enterprise of the Howe Sound Co. which includes

Digitized by Google

complete mining, milling, power, and transportation facilities for an operation of 2,000 tons daily capacity; other expenditures, made prior to 1938 (the first full year of operation), include new cyanide mills at Republic, Orient, and Azurite and new power and milling capacity at Metaline Falls. All the large increases in output were made at properties that have new or recently improved physical plants, and as a result of these improvements the value of the State output in 1938 was more than five times that in 1936.

### ORE CLASSIFICATION

Details of ore classification are given in the chapter of this volume on Gold and Silver.

*Ore sold or treated in Washington in 1938, with content in terms of recovered metals*

| Source | Mines producing | Ore | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|---|
| | | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Dry and siliceous gold ore | 49 | 271,557 | 41,869 | 127,395 | 7,038 | 7,897 | ---------- |
| Dry and siliceous gold-silver ore | 2 | 61 | 6 | 499 | 58 | 740 | ---------- |
| Dry and siliceous silver ore | 6 | 7,229 | 73 | 110,620 | 41,783 | 58,979 | ---------- |
| | 57 | 278,847 | 41,948 | 238,514 | 48,879 | 67,616 | ---------- |
| Copper ore [1] | 5 | 373,120 | 30,650 | 124,307 | 11,983,694 | ---------- | ---------- |
| Lead ore | 13 | 538 | 2 | 3,315 | 1,427 | 481,884 | ---------- |
| Zinc-lead ore | 2 | 249,184 | ---------- | 14,584 | ---------- | 8,018,500 | 22,804,000 |
| Total, lode mines | 77 | 901,689 | 72,600 | 380,720 | 12,034,000 | 8,568,000 | 22,804,000 |
| Total, placers | 80 | ---------- | 1,575 | 218 | ---------- | ---------- | ---------- |
| | 157 | 901,689 | 74,175 | 380,938 | 12,034,000 | 8,568,000 | 22,804,000 |
| Total, 1937 | 155 | 294,826 | 36,310 | 126,304 | 128,000 | 5,660,000 | 8,232,000 |

[1] By far the greatest part of this ore is an unusual copper- [gold-silver] ore necessitating a close decision between "copper ore" and "gold ore" according to Bureau of Mines Minerals Yearbook classification.

## METALLURGIC INDUSTRY

The total output of ore in Washington in 1938 was 901,689 tons; it comprised 212,161 tons treated at gold and silver mills, 631,864 tons treated at concentration plants, and 57,664 tons shipped crude to smelters.

*Gold and silver mills.*—Seven small straight amalgamation plants treated 2,071 tons of gold ore, recovering 439 ounces of gold and 230 ounces of silver in amalgamation bullion and 58 tons of gold concentrates yielding 111 ounces of gold and 190 ounces of silver.

Three straight cyanidation plants and one combined cyanidation and corduroy-concentration plant treated 210,090 tons of ore concontaining (original or gross contents) 31,550 ounces of gold and 67,857 ounces of silver; the cyanide precipitates yielded 27,061 ounces of gold and 57,663 ounces of silver and the concentrates yielded 2,344 ounces of gold and 213 ounces of silver, indicating average over-all recoveries of 93 percent of the gold and 85 percent of the silver. Cyanidation reagents consumed at the four plants comprised 201,992 pounds of sodium cyanide (91-percent grade), 28,480 pounds of Aero Brand calcium cyanide, 41,822 pounds of zinc dust, and 1,205,082

Digitized by Google

pounds of lime; other reagents reported included lead acetate, litharge, soda ash, and starch.

*Concentration plants.*—The 631,864 tons of ore treated at concentration plants comprised 373,000 tons of copper ore treated at three plants, 249,184 tons of zinc-lead ore at two plants, 7,180 tons of silver ore at three plants, and 2,500 tons of gold ore at four plants.

Details of the treatment of all ore produced in Washington in 1938 are given in the following tables.

*Mine production of metals in Washington in 1938, by methods of recovery, in terms of recovered metals*

| Method of recovery | Material treated | Gold | Silver | Copper | Lead | Zinc |
|---|---|---|---|---|---|---|
| | *Short tons* | *Fine ounces* | *Fine ounces* | *Pounds* | *Pounds* | *Pounds* |
| Ore amalgamated | 2,071 | 439 | 230 | | | |
| Ore cyanided | 210,090 | 27,061 | 57,663 | | | |
| Concentrates smelted | 52,335 | 33,549 | 248,414 | 11,991,876 | 8,080,690 | 22,804,000 |
| Ore smelted | 57,664 | 11,551 | 74,413 | 42,124 | 487,310 | |
| Placer | | 1,575 | 218 | | | |
| | | 74,175 | 380,938 | 12,034,000 | 8,568,000 | 22,804,000 |

### ASOTIN COUNTY

The entire output of gold and silver from Asotin County in 1938 came from placer operations along the Snake River near Asotin and Clarkston; the output increased considerably owing to the operation of a small dragline and washer near Clarkston.

### BENTON COUNTY

Three placers on the Columbia River near Paterson and Richland were active in 1938. Most of the output came from the mechanical washing plant of the Gone Busted placer on Blalock Island near Paterson.

### CHELAN COUNTY

*Chelan district.*—The Holden mine, high in the Cascade Mountains about 54 miles northwest of Chelan, has long been known as a potential producer of copper, gold, and silver, but inadequate transportation and power facilities greatly retarded development. The property was acquired by the Howe Sound Co. in 1930, and the Chelan Division of the company was formed to operate it. After an extensive period of exploration and mine development, actual construction of the mining and milling plants was started in 1937. The new plant, with an initial capacity of 1,000 tons a day, was placed in operation April 1, 1938. Supplementary construction included a 53-mile electric transmission line, docks, roads, miscellaneous camp buildings, etc. During the summer and fall of 1938 the mill was enlarged, and by the end of the year it was treating 2,000 tons of ore daily by flotation concentration. The concentrates are hauled by truck to Lucerne, a landing on Chelan Lake, and thence by barge to Chelan and by rail to Tacoma for smelting. The gold content of the concentrates produced is unusually high for copper ores and is nearly as valuable as the copper content; considerable silver also is recovered. During 1938 the company milled 371,800 tons of ore and was by far the most important mining operation in the State; the mine ranked first in output of gold, silver, and copper. Nearly 16,000 feet of mine development was done during 1938, and employment was provided for an average of 413 men.

The American Smelting & Refining Co. operated a property near Wenatchee during the last quarter of 1938 and shipped nearly 11,000 tons of highly siliceous low-grade gold ore to the smelter at Tacoma. The material is used as siliceous flux in the copper-smelting operations, replacing barren siliceous material (beach sands) in the furnace charges.

### FERRY COUNTY

*Republic district.*—Mines in the Republic district produced gold and silver valued at $972,904 in 1938 compared with $698,693 in 1937. Knob Hill Mines, Inc., was again the largest producer at Republic; the company operated the new 400-ton cyanide plant the entire year, treating 147,514 tons of ore from the Knob Hill property and 4,565 tons of old tailings from the Mountain Lion property, which was acquired during the year. No crude ore was shipped from the Knob Hill, but about 8,300 tons of smelting ore were shipped from the Mountain Lion. The Eureka Mining & Milling Co. continued

Digitized by Google

operation of both the Quilp and Republic groups; the cyanide mill treated 9,828 tons of Quilp ore during the first 5 months of the year, but the plant was closed and dismantled after June 1; shipments of crude ore to smelters continued throughout the year from both the Quilp and Republic mines. Lessees continued shipments of gold ore of smelting grade from various properties of the Aurum Mining Co. during 1938; the company resumed development late in the year, and a mill was reported under consideration for the Last Chance group. The remainder of the district lode production was siliceous ore shipped for smelting from several properties, including the California, El Caliph, Golden Harvest, Morning Glory, Opal, and Seattle mines. The ore of smelting grade was shipped to Tacoma, Wash., and Trail, British Columbia.

The remainder of the output from Ferry County comprised gold ore shipped for smelting by the Morning Star Mining Co. at Danville; lead ore from the Lucky Boy mine near Inchelium; and placer dust and retorts from operations along the Columbia River and at Republic, chiefly from the Plumb Bar near Keller.

### KING COUNTY

Apex Gold Mines, Inc., started milling operations at its property in the Miller River district in 1938; several hundred tons of gold ore were treated in the 75-ton flotation plant, and gold concentrates were shipped to Tacoma. Siliceous ore was shipped for smelting from the Coney Basin and Cleopatra & Aces Up properties, also in the Miller River district.

### KITTITAS COUNTY

Small lots of placer dust were marketed in 1938 from several properties on Swauk Creek, chiefly from the Sunny Bar property; producing lode mines included the Mountain Daisy, Wall Street, and Ione Fraction.

### OKANOGAN COUNTY

Suspension of operations by the Northern Gold Corporation at the Bodie mine near Wauconda (Cascade district) early in 1938 resulted in a sharp decrease in gold production from Okanogan County. An increase was recorded at the Arlington property in the Palmer Mountain district, as Arlington Mines, Inc., remodeled the flotation plant and milled 5,330 tons of silver ore; concentrates rich in copper and silver were shipped to Tacoma. Other producing lode mines in Okanogan County in 1938 included the Whitestone and Golconda mines in the Cascade district; the Chief Sunshine and Seven Devils mines near Conconully; the Mazama Queen and Red Shirt mines in the Methow district; the Mother Lode, Overtop, Gray Eagle, and Peterson mines in the Myers Creek and Mary Ann Creek district; and the Hiawatha, John Judge, Triune, American Rand, and Owasco mines in the Palmer Mountain district. Placer production was reported from properties along the Columbia and Similkameen Rivers and from Myers Creek and Mary Ann Creek.

Digitized by Google

### PEND OREILLE COUNTY

*Metaline district.*—The Pend Oreille Mines & Metals Co. operated its mine and 600-ton flotation plant near Metaline Falls continuously during 1938 and treated 214,120 tons of zinc-lead ore, the greatest output in the history of the company; the flotation plant was enlarged during 1937 and operated at capacity during 1938. The Metaline Mining & Leasing Co. operated its mine for 5 months (January, February, March, November, and December) in 1938 and treated 35,064 tons of zinc-lead ore in the 300-ton flotation plant. The products (lead concentrates and zinc concentrates) of the two mills were shipped to reduction plants outside the State for treatment. The combined output of the two mines was the largest in the history of Pend Oreille County and established a new record zinc output for the State.

### SNOHOMISH COUNTY

Copper ore was produced in 1938 at the Sunset mine in the Index district and the Florence Rae mine in the Sultan district. Placer dust was recovered at several properties along the Sultan River.

### STEVENS COUNTY

The First Thought Mine Corporation operated the 50-ton cyanidation plant near Orient throughout 1938 and treated 11,668 tons of gold ore, an increase from 4,683 tons in 1937; cyanide bullion yielding 1,723 ounces of gold and 963 ounces of silver was marketed. The Ark Mines Co. operated the Silver Queen property near Kettle Falls and treated about 1,700 tons of silver ore by flotation, shipping lead-copper concentrates to Kellogg, Idaho, for smelting. Other producing lode mines in Stevens County included the Young America and Silver Trail mines near Bossburg; the Copper King mine at Chewelah; the Old Dominion and Middleport mines at Colville; the Electric Point, Red Top, Melrose, and Burrus mines in the Northport district; the McNally mine at Orient; and the Queen Seal and Cleveland mines near Springdale. Placer operations along the Columbia River in Stevens County accounted for the bulk of the State placer output; most of it came from the Collins, Grover, Gibson, and B & W properties. Much of the placer ground on the Columbia River in Stevens and Ferry Counties ultimately will be submerged by the reservoir created by Grand Coulee Dam.

The General Electric Co. operated the Germania mine near Springdale the entire year and treated 28,641 tons of tungsten ore in the 100-ton concentration plant. A little molybdenum ore was produced at the Monitor mine east of Fruitland by the Deertrail Monitor Mines Co.

### WHATCOM COUNTY

The American Smelting & Refining Co. continued regular operations at the Azurite mine in the Slate Creek district during 1938 and treated 36,515 tons of gold ore in the 100-ton cyanidation and corduroy-table concentration mill; cyanide bullion yielded 9,562 ounces of gold and 1,100 ounces of silver, and 24 tons of concentrates yielded 2,344 ounces of gold and 213 ounces of silver. The Boundary Red Mountain mine in the Mount Baker district was not operated in 1938, but a little mill

Digitized by Google

clean-up material was amalgamated. Gold ore from the New Light mine was also amalgamated, and gold ore was shipped for smelting from the Gold Run and Allen Basin mines.

### YAKIMA COUNTY

The Copper Mining Co. treated 150 tons of copper ore in a small concentrator and shipped 11 tons of copper concentrates for smelting; the company also produced a small quantity of tungsten concentrates.

# GOLD, SILVER, COPPER, AND LEAD IN WYOMING

(MINE REPORT)

By CHAS. W. HENDERSON AND A. J. MARTIN

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 493 | Mine production by counties | 494 |
| Calculation of value of metal production | 493 | Review by counties and districts | 494 |

The annual gold production of Wyoming dropped below 1,000 ounces in 1938 for the first time since the dragline dry-land dredge method of mining placer deposits was introduced in the State in 1933. In that year and in each succeeding year through 1938 placers worked by this method have yielded most of the State gold. The only silver produced in Wyoming in 1938 that was not a byproduct of gold mining was 34 ounces contained in silver ore shipped from the Sunlight district, Park County. The Atlantic City district, Fremont County, continued to be the principal gold-producing district of the State. No recoverable copper or lead has been produced in Wyoming since 1935.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production herein reported has been calculated at the following prices.

*Prices of gold, silver, copper, lead, and zinc, 1934–38*

| Year | Gold [1] | Silver [2] | Copper [3] | Lead [3] | Zinc [3] |
|---|---|---|---|---|---|
| | *Per fine ounce* | *Per fine ounce* | *Per pound* | *Per pound* | *Per pound* |
| 1934 | $34.95 | [4] $0.646+ | $0.080 | $0.037 | $0.043 |
| 1935 | 35.00 | .71875 | .083 | .040 | .044 |
| 1936 | 35.00 | .7745 | .092 | .046 | .050 |
| 1937 | 35.00 | .7735 | .121 | .059 | .065 |
| 1938 | 35.00 | [4] .646+ | .098 | .046 | .048 |

[1] 1934: Yearly average weighted Government price; 1935–38: Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] 1934 and 1938: Treasury buying price for newly mined silver; 1935–37: Yearly average weighted Treasury buying price for newly mined silver.

[3] Yearly average weighted price of all grades of primary metal sold by producers.

[4] $0.64646464.

The following table shows the annual output of ore from lode mines producing gold, silver, copper, and lead and the quantity and value of the metals recovered from both lode and placer mines in Wyoming from 1934 to 1938; it also gives the total metal production from 1867 to 1938. About three-fourths of the total recorded value of the four metals is in copper, most of which was mined before 1924 in the Encampment district in Carbon County and the Hartville district in Laramie County.

## REVIEW BY COUNTIES AND DISTRICTS

### ALBANY COUNTY

*Douglas Creek district (Holmes, Keystone).*—The Clark's Fork Co. moved its dragline and dry-land dredge from Clark Fork, Park County, to placer ground on Douglas Creek 3 miles from Holmes, Albany County, and operated them from August 15 to November 1, 1938. Individuals sluicing on streams near Holmes recovered small quantities of gold.

### CARBON COUNTY

*Encampment or Upper Platte district.*—A car of gold ore was shipped from the Golden Clover property to the Garfield (Utah) smelter in June 1938.

*Spring Creek district.*—The Saratoga Mining Co. installed machinery for placer mining on the Phillips placer on North Spring Creek and operated for a period in 1938. Small-scale placering was done by individuals on Spring and Savery Creeks.

Digitized by Google

### FREMONT COUNTY

*Atlantic City district.*—The E. T. Fisher Co. moved its dragline excavator and portable traction screening and sluicing plant from the property of the Timba-Bah Mining Co. on Rock Creek, where it had operated since 1933, to new ground comprising the Lemley and other placers farther up Rock Creek northwest of Atlantic City, where operations were carried on after June 1, 1938. Although its output of gold decreased from 1,415 fine ounces in 1937 to 406 ounces in 1938, the company continued to be the principal producer of gold in the State. A dragline and washing plant operated on the Bonanza placer in Meadow Gulch from October 9 to October 31, 1938, recovered 45.86 crude ounces of placer gold averaging 0.910 fine in gold and 0.089 fine in silver. A lessee on placers in Strawberry and Poorman Gulches used a concentrating table and sluices to treat his gravel, and other placer miners in the Atlantic City district used hand sluices and pans.

Dump material from the Iron Duke property at Lewiston was trucked to the Gold Dollar mill of the Miners Delight Consolidated Mines Co. and treated by amalgamation. The B & H Gold Mining Co. shipped 147 tons of ore containing 96.09 ounces of gold and 197 ounces of silver from the Little Ellen No. 3 mine to smelters in Utah. The mine is opened by a vertical shaft 105 feet deep and 250 feet of drifts. The Christiana claim was under development by the Carya Mining & Development Co. from about March 15 to May 15, 1938. The underground workings completed when work was suspended because of lack of capital for development comprised a 100-foot shaft, a 160-foot tunnel, and a 200-foot raise. The company erected a 20-ton amalgamation-gravity concentration mill and made a test run that yielded gold-silver bullion containing 6.53 fine ounces of gold and 6 fine ounces of silver. Sample lots of ore shipped from two other properties and a clean-up of stamp battery boxes at the Carissa mine yielded some gold and silver.

*Granite Mountains district.*—The Emigrant Mining Co. did retimbering, shaft straightening, and 33 feet of development work from July to November 2, 1938, at the Red Boy property in sec. 36, T. 31 N., R. 93 W., sixth principal meridian.

### PARK COUNTY

*Sunlight district.*—Four partners drove 20 feet of crosscut and 40 feet of drift on the Tip Top claim at the head of Galena Creek 18 miles southwest of Painter in 1938. They shipped 0.848 ton of ore assaying 0.01 ounce of gold and 39.90 ounces of silver to the ton, 0.7 percent copper, and 2.3 percent lead to the Bunker Hill smelter at Kellogg, Idaho.

### SHERIDAN COUNTY

A placer miner sluicing on Rooster Creek in the Little Big Horn River area in northwestern Sheridan County recovered dust 0.961 fine in gold and 0.035 fine in silver in 1938.

### TETON COUNTY

Frank J. Allen worked his Sterling placer, comprising three claims on Pacific Creek northeast of Moran, with a sluice box from July 1 to October 30, 1938, and produced 2.87 ounces of placer gold 0.917 fine.

# SECONDARY METALS—NONFERROUS

By J. P. Dunlop [1]

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| General summary | 497 | Secondary tin | 504 |
| Scope of report | 497 | Secondary aluminum | 506 |
| Secondary metals recovered | 498 | Secondary antimony | 509 |
| Secondary copper and brass | 501 | Secondary nickel | 510 |
| Secondary lead | 502 | Classification of old metals | 511 |
| Secondary zinc | 503 | | |

The total value of certain nonferrous metals, for which the quantity recovered from secondary sources is reported to the Bureau of Mines, was $137,915,800 in 1938—$101,215,000 less than in 1937; the total quantity decreased 299,810 short tons. The decline in total value was due partly to lower average prices for copper, zinc, tin, and lead, but the recovery of secondary copper, zinc, tin, aluminum, antimony, lead, and nickel all decreased.

*Secondary metals of certain classes recovered in the United States, 1937–38*

| | 1937 | | 1938 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Copper, including that in alloys other than brass | 387,600 | $93,799,200 | 252,700 | $49,529,200 |
| Brass scrap re-treated | 206,400 | 41,677,000 | 153,100 | 24,668,400 |
| Lead as metal | 154,500 | 32,461,800 | 119,400 | 20,690,800 |
| Lead in alloys | 120,600 | | 105,500 | |
| Zinc as metal | [1] 64,540 | [1] 9,839,700 | 42,270 | 4,672,300 |
| Zinc in alloys other than brass | 11,150 | | 6,400 | |
| Tin as metal | 8,270 | 32,124,100 | 4,900 | 19,284,600 |
| Tin in alloys and chemical compounds | 22,030 | | 18,710 | |

[1] Revised figures.

*Scope of report.*—"Secondary metals" are those recovered from scrap metal, sweepings, skimmings, and drosses and are so called to distinguish them from metals derived directly from ores, which are termed "primary metals." The distinction does not imply that secondary metals are of inferior quality, for metals derived either from ore or waste material vary in purity and in adaptability to use in making certain products. The figures supplied by producers cover seven metals—secondary copper, lead, zinc, tin, aluminum, antimony,

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Digitized by Google

and nickel—and supplement those in the various chapters of this volume on the primary metals. They are given to enable producers and consumers to form a more comprehensive idea of the quantities of metal available for consumption; in fact, they constitute an essential complement to the figures in the general reports on the primary metals and will become even more valuable in future.

The variety of waste material (especially metallic waste), its utilization, and much information on its collection and disposal appear in reports of this series for preceding years. These reports name the various trade papers that handle data on secondary metals and refer to many articles relating to secondary metals recovered.

Several papers[2] presented at the 1939 annual meeting of the National Association of Waste Material Dealers, Inc., dealt with the problems and needs of metal dealers and brokers in the scrap-metal industry.

## SECONDARY METALS RECOVERED

The quantity of metals contained in numerous alloys made partly or wholly from secondary material cannot be ascertained definitely. The figures in the following tables and text, which are based upon results of the annual canvass, are approximate but constitute the only data available on an industry of growing importance.

Mints and refineries reported the recovery of 870,881 fine ounces of gold and 18,438,847 fine ounces of silver from waste or discarded material in 1938 compared with 1,040,227 ounces of gold and 23,564,986 ounces of silver in 1937. Jewelry and dental waste furnish the largest quantity of secondary gold[3] and silverware and photographic waste the largest quantity of secondary silver. Considerable gold and silver are recovered from plating solutions.[4]

No statistics collected by the Bureau of Mines show the quantity and value of old rails, pipe, machinery, and other equipment renovated for original use. Data issued by newspapers and trade publications indicate that an enormous quantity of such material is salvaged and reused. Scrap-metal collectors and dealers dispose of much of their stock to others than smelters and refineries. Foundries buy considerable quantities of good-grade copper, aluminum clippings, and tin clippings. Other customers purchase pipe, rails, stoves, radiators, boilers, and similar materials too valuable and salable to go to the melting pot.

In 1938 the price of heavy copper scrap ranged from 6.125 to 9.25 cents a pound, No. 1 composition scrap from 4.625 to 7.875 cents a pound, old zinc scrap from 1.88 to 3 cents a pound, cast-aluminum scrap from 4.625 to 9.375 cents a pound, and heavy lead scrap from 2.875 to 4.25 cents a pound.[5] This range of scrap-metal prices in 1938 was generally below that in 1937, and the quantities collected and sold were very much less, so that profits to dealers and smelters de-

Digitized by Google

creased. Prices were only fairly good in the first quarter, but there was a steady drop until the year's lows were reached in May and June. Prices then rose until they reached the high point of the year in October, then tapered off slightly. The last half of 1938 pulled the industry out of the doldrums and made the outlook for 1939 promising as to expanded business, with not much change in opening prices.

The sharp decline in the output of motorcars and in other metal-consuming industries in 1938 cut the quantity of new scrap as much as 25 to 35 percent for some metals and alloys. Die-casting and zincking fell off so that very much less zinc dross and skimmings were available for redistillation. Notwithstanding the lower prices, most of the urban scrap was shipped promptly; but the collections of old brass, batteries, and aluminum in rural districts were much less than in 1937, and shipments to secondary smelters and foundries lagged. There was little change in the number of secondary smelters. Only a few became insolvent, and few new plants were operated. The decline in the quantity of scrap and drosses treated was especially notable at some of the largest plants, for scrap dealers and brokers were not especially anxious to turn loose material bought at low prices.

Regular primary smelters treated 5,186 tons less lead scrap and 64,064 tons less copper scrap in 1938 than in 1937. The quantity of tin-plate scrap treated decreased about 15 percent. Secondary smelters handled much less brass and aluminum and alloys containing zinc and tin, secondary brass decreasing more than 53,000 tons.

A paper by James S. Earle, of the Bureau of Mines, was read at the meeting of the National Association of Waste Material Dealers. It is impossible, for lack of space, to reproduce all the article, but the following excerpts state some pertinent facts.

*Secondary metal industry enjoys rapid growth.*—Considering the enormous size and rapid growth of this reservoir of potential scrap it is not surprising that the secondary metal industry has enjoyed a phenominal advance. Because this reservoir is so broadly distributed throughout the country, your industry serves virtually every village and hamlet in the nation. There can be no doubt that as time goes on the reworking of scrap from this source will increase in importance, as undoubtedly the upward trend in the use of metals will continue for many years to come.

Another important source of raw material for the secondary metal industry is the metal scrap derived as a byproduct from manufacturing operations. This too has increased greatly in volume with the tremendous rise in industrial activity since the beginning of the century. Much of this type of scrap, however, bypasses the secondary metal trade owing to the fact that manufacturers are improving their facilities for treating their own scrap and to the growing tendency of producers of sheets, bars, and rods to take back scrap direct from their customers. Nevertheless, a substantial amount of this byproduct metal enters the scrap trade, although in comparison with metal reclaimed from use it is less important as a source of supply. The present state of development of the secondary metal industry, with its widespread activity, is thus due largely to the scrap available in the large stocks of metal in use in all parts of the country.

Before considering the various factors that control the flow of scrap from these major sources it will be helpful to define various economic classifications of scrap. Metal returning from the store of metal in use may be referred to as "old scrap" in contrast to the byproduct of industry designated "new scrap." Old scrap may be derived from capital goods, such as buildings and industrial machinery and equipment, or from consumer goods, such as automobiles, radios and cooking utensils. In general it may be stated that there is a larger reclamation of the metal consumed in capital goods than in consumer goods. It will be observed that the essential difference between old and new scrap is that the former represents metal that has been in use and is now returning because of obsolescence, whereas new scrap is essentially metal that has not yet reached the stage of final use. New

Digitized by Google

scrap is not as widespread in origin as old scrap, as it is found only in industrial areas; old scrap is to be found wherever human beings exist.

*Reclamation of old metals.*—From the standpoint of the scrap metal dealer or refiner, it makes little difference whether the material he trades or uses is old or new scrap, but from the standpoint of conservation there is a significant difference. New scrap is merely refined metal in one stage of manufacture and the volume available at any given time depends on the rate of industrial production. It may be described as metal on the way to an ultimate use, and its flow occurs more or less automatically as an integral part of the manufacturing process. Old scrap, on the other hand, has reached the stage of ultimate use and, having served its purpose for whatever application it was designed, is now being reclaimed for another cycle of manufacture and use. As such, it relieves the necessity of extracting an equivalent amount of metal from the mines and thus prolongs the life of our limited metalliferous ore reserves. The services performed by your industry in collecting objects discarded by the population and returning them to use is perhaps the most real contribution to conservation actually being accomplished today.

From the viewpoint of the consumer, scrap may be classified further according to origin or ownership. "Plant scrap" or "home scrap" refers to material that originates in the same plant in which it is reworked. This type consists largely of new scrap resulting from current manufacturing operations, but occasionally some old scrap obtained from dismantling obsolete plant and equipment may be included. "Purchased scrap," as its name implies, is material that the consumer obtains from other sources. All scrap supplied by waste-material dealers would be designated as purchased scrap by the consumer. It contains both old and new scrap. It will be observed that plant scrap passes through the cycle from production to recovery without change of ownership whereas in the case of purchased scrap one or more changes in title may be involved.

*Industry sensitive to changes.*—The secondary metal industry in general is subject to the same economic factors that influence other productive enterprises. When industrial activity is at a high level prices are generally remunerative, and the volume of trade in scrap is quite satisfactory. Since new scrap is merely a by-product of current manufacturing operations, trade in this material naturally rises and falls with industrial activity. By and large, new scrap moves irrespective of price levels because, as a rule, manufacturers do not care to speculate on their scrap and many of them have very limited facilities for storing large quantities. Since the money return from scrap is a relatively small part of their total business, they prefer to keep the material moving away from their plants. At times of high prices, the incentive for collecting old scrap is greater and consequently at periods of high industrial activity there is a greater return of this material. Occasionally, however, the quantity of old scrap resulting from the demolition of capital goods may be higher in periods of low industrial activity because of the necessity for curtailing productive activities and the desire to maintain employees by providing other types of work such as dismantling obsolete plants.

The limits of scrap supply at any given time are determined by the cost of delivery to the consumer and by prices. When prices are down, the flow diminishes, and if prices are low enough, the movement ceases almost entirely because the material is not worth transporting to markets. The trade in scrap is greatly influenced by freight rates, the volume of industrial activity, the rate at which obsolescence and abandonment takes place, and stocks on hand at dealers yards and consumers plants. Some of these factors are amenable to precise evaluation but others, including some of great significance to the scrap metal trade, are little understood primarily because of a lack of basic statistical data.

*Scrap's effect on metal prices.*—The effect of scrap on metal prices appears to be a field requiring more study. When business is good, price levels for scrap appear to be determined by the supply and demand for virgin metals. But when prices reach unreasonably high levels unexpected supplies of scrap deluge the market and break prices. This has happened on more than one occasion. Likewise, when consumption is at a low level, scrap exerts a depressing effect, as was demonstrated in copper during the depression. Within the last few months we have witnessed the paradoxical situation of electrolytic copper selling on the open market at a considerable discount from the so-called official producers price, an event attributed largely to the influence of scrap.

The classification and sorting of scrap metal are tremendously important factors and ones in which there is room for improvement. Owing to the marked advance in the use of alloys the modern junk pile is a very complex affair. Proper classification of scrap not only pays dividends to the collector but from the national

Digitized by Google

point of view permits better recovery of many valuable alloying elements now going to waste. Development of more simple and inexpensive methods of classification would be a distinct benefit to all concerned.

In the foregoing remarks an attempt has been made to outline briefly the fundamental soundness of the secondary metal industry and to point out some of the factors influencing the flow of scrap. We have seen that there is need for a broader understanding of the basic economics of this industry. We have seen, also, that the reservoir of metal in use is a national asset equivalent to the crude metallic minerals contained in the earth's crust. It is not surprising, therefore, that the Government agencies chiefly concerned with the conservation of mineral raw materials have been interested in the recovery of secondary metals for many years.

*Secondary copper and brass.*—Copper produced in 1938 by smelters that handle scrap metals and drosses exclusively included 99,858 tons of pig copper (part of which was electrolytically refined), 107,100 tons of copper in remelted brass, and 60,300 tons in alloys other than brass. These figures indicate decreases of 29,136 tons of pig copper, 37,400 tons of copper in brass, and 41,700 tons in copper alloys other than brass. Regular copper smelters produced 64,064 tons less secondary copper in 1938 than in 1937.

The total value of secondary copper as metal and in brass and other alloys computed at 9.8 cents a pound (the average price in 1938 of all merchantable grades of new metal) was $70,520,800, about $58,247,400 less than in 1937.

Scrap-copper exports increased 897 tons and scrap-brass exports decreased 2,563 tons in 1938 compared with 1937.

*Secondary copper recovered in the United States, 1937–38, and imports and exports of brass and copper scrap, in short tons*

| | 1937 | 1938 | | 1937 | 1938 |
|---|---|---|---|---|---|
| Copper as metal | [1] 285,600 | [1] 192,400 | Total secondary copper (including copper content of brass scrap): | | |
| Copper in alloys other than brass | 102,000 | 60,300 | From new scrap | 123,200 | 92,500 |
| | 387,600 | 252,700 | From old scrap | 408,900 | 267,300 |
| Copper from new scrap (not including brass) | 61,600 | 40,000 | | 532,100 | 359,800 |
| Copper from old scrap (not including brass) | 326,000 | 212,700 | As metal | 285,600 | 192,400 |
| | 387,600 | 252,700 | In brass and other alloys | 246,500 | 167,400 |
| | | | | 532,100 | 359,800 |
| Brass scrap remelted: | | | Brass scrap imported | [2] | |
| New clean scrap | 88,000 | 75,000 | Scrap copper imported | 41 | [3] |
| Old scrap | 118,400 | 78,100 | Brass scrap exported | 18,551 | 15,988 |
| | 206,400 | 153,100 | Scrap copper exported | 20,914 | 21,811 |
| Copper content of brass scrap (averaging 70 percent copper): | | | | | |
| New scrap | 61,600 | 52,500 | | | |
| Old scrap | 82,900 | 54,600 | | | |
| | 144,500 | 107,100 | | | |

[1] Of these totals secondary copper reported by smelters and refiners that treat mainly primary metal comprised 156,606 tons in 1937 and 92,542 tons in 1938.
[2] 611 pounds, gross weight.
[3] 190 pounds, gross weight.

The terms "new brass scrap" and "new copper scrap," as applied in the preceding table, refer to the scrap accumulated in fabricating products; "old scrap" is the metal that was made into products and after service has been discarded and returned to be remelted or refined for further use. Few junkmen, dealers, or smelters keep any statistics of "old scrap" and "new scrap." Most of the new scrap is clippings, grindings, and defective articles made in the ordinary operations in

Digitized by Google

fabricating goods, some of which is reused at the plant and the remainder sold. All foundries and rolling mills (many of which purchase scrap metals) are advised in the Bureau of Mines questionnaire to exclude all scrap made and used in their own plants and to give data on purchased scrap alone. Those that purchase only "new scrap" of certain grades and assay can give correct data; the others usually can make some distinction between "new" and "old" scrap. Secondary smelters usually cannot give exact figures but occasionally can estimate the proportion of "new" scrap metal treated. The figures in the preceding table are the best obtainable.

Reports for 1938 show that railroads reused the following quantities of scrap metals at their shops and foundries: 6,730 tons of brass; 592 tons of copper; 9,071 tons of copper in alloys other than brass; 990 tons of tin in babbitt, solder, and bronze; and 4,400 tons of lead in various alloys.

*Secondary lead.*—The output of secondary lead in 1938 equaled 58.6 percent of the total production of refined primary lead from domestic and foreign sources in the United States compared with 59 percent in 1937. Much recovered lead is derived from discarded batteries, pipe, sheet, and lead-covered cable; other sources are type metal, solder, babbitt, and shot.

Secondary lead recovered by smelters whose product is mainly primary metal decreased 5,186 tons in 1938. The output of pig lead by secondary smelters decreased about 29,900 tons and that of lead in scrap alloys 10,879 tons.

Owing to the greatly decreased output of motor cars and the smaller number of scrapped cars in 1938 the quantity of old batteries smelted was much less than in 1937. Apparently urban dealers collected fewer batteries but did not hold them for higher prices. Some stocks of batteries are held in rural areas, but the total quantity is not large. Recovery of battery plates is expected to increase in 1939 because purchases of new motor cars are larger. A number of secondary smelters treating old batteries and other lead alloys now recover much of the lead as good-grade pig lead. The residues and drosses containing antimony are then used in making hard lead containing various percentages of antimony. Some of the problems in handling old batteries are stated in an article by Neuman.[6]

*Secondary lead recovered in the United States, 1937–38, in short tons*

| | 1937 | 1938 |
|---|---|---|
| Secondary lead recovered by smelters that treat mainly ore | 29,986 | 24,800 |
| Secondary lead recovered by smelters that treat only scrap and drosses | 124,514 | 94,600 |
| | 154,500 | 119,400 |
| Secondary lead recovered in remelted alloys: | | |
| Estimated secondary lead content of antimonial lead produced at regular lead smelters[1] | 15,391 | 11,170 |
| Lead content of drosses and scrap alloys treated at secondary smelters | 105,209 | 94,330 |
| | 120,600 | 105,500 |
| Total secondary lead recovered | 275,100 | 224,900 |

[1] Antimonial lead produced at primary smelters totaled 27,534 tons containing approximately 7,833 tons of primary domestic lead, 1,721 tons of primary foreign lead, 1,636 tons of primary domestic antimony, 90 tons of primary foreign antimony, 15,391 tons of secondary lead, and 853 tons of secondary antimony in 1937 compared with 24,123 tons containing approximately 6,759 tons of primary domestic lead, 3,385 tons of primary foreign lead, 2,080 tons of primary domestic and foreign antimony, and 11,170 tons of secondary lead, and 729 tons of secondary antimony in 1938.

*Refined primary lead produced in the United States, 1937–38, in short tons*

| | 1937 | 1938 |
|---|---|---|
| From domestic ore | 443,142 | 331,964 |
| From foreign ore and base bullion | 24,175 | 51,705 |

The American Bureau of Metal Statistics estimates that each of the 14,500,000 automobile batteries made in 1938 contained an average of 21.6 pounds of lead and antimony, the same as in 1937. The average in each battery in 1936 was 23.7 pounds and in 1933, 25.1 pounds.

The sampling of battery plates is much more difficult than the assaying, owing to the moisture in the rubber and separators.

Numerous old batteries are smelted on toll by custom smelters. The smelters also purchase batteries at a price based on that of pig lead at St. Louis; the antimony content is, however, paid for at the price of lead, although the price of antimony in 1938 was about three times that of lead.

It is generally considered that too high prices have been and are being paid to holders of old batteries, that dealers pay too much for them, and in turn that the smelters' and refiners' profit is normally too small. Frequently the recovery of the antimony alone yields any profit. A humorously expressed argument for concerted action to remedy this condition was given in a paper [7] read at the meeting of the National Association of Waste Material Dealers on March 21–22, 1939. Old batteries are a problem to dealers and smelters as well as to the sellers of primary lead because they are scrapped and return to stocks in such a comparatively short time. Another article presented at the same meeting stated the factors other than the quoted prices of primary lead that determined the prices offered for battery lead.[8]

Admittedly there are many factors, which are stated, but the main one is that the selling price depends primarily on the price and activity of antimonial lead and not on the price of and demand for primary lead.

*Secondary zinc.*—Secondary zinc recovered as pig metal and in alloys (including brass) decreased 40,220 short tons. The zinc content of brass remelted was 13,200 tons less in 1938 than in 1937. The total recovery of secondary zinc (including that in brass) equaled 20 percent of the total output of primary slab zinc in the United States (446,341 tons) in 1938. In addition, large quantities of the zinc dust, zinc chloride, and other compounds were made from zinc drosses and residues.

[1] Figures do not include scrap and dross used for lithopone or chloride. The use for zinc chloride, especially, is large.
[2] Revised figures.
[3] Data not available.

Zinc recovered by redistillation decreased from 51,554 tons in 1937 to 31,613 in 1938. Of the 1938 total, 14,003 tons (a decrease of 10,128 tons) were recovered at primary smelters from zinc drosses and 17,610 (a decrease of 9,813 tons) at six secondary plants that used large graphite retorts, two plants that used clay retorts, and one that used both, which treated only drosses and residues in 1938. The large decrease in the recoveries of redistilled zinc was the normal result of the greatly reduced quantity of zinc used in zincking and in die casting. It is estimated that 40 to 45 percent less zinc was used in die casting in 1938 than in 1937. Much of the decrease was due to the sharp decline in the number of motorcars made in 1938. The seven active smelters using large graphite retorts in 1938 were:

W. J. Bullock, Fairfield, Ala.
Federated Metals Corporation, Trenton, N. J.
General Smelting Co., Philadelphia, Pa.
Nassau Smelting & Refining Co., Tottenville, N. Y.
Pacific Smelting Inc., Ltd., Torrance, Calif.
Superior Zinc Corporation, Bristol, Pa.
Wheeling Steel Corporation, Wheeling, W. Va.

Of the total output of 122,297 tons of lithopone in 1938, 58,563 tons containing 11,262 tons of zinc were made from zinc skimmings and ashes.

The American Bureau of Metal Statistics estimates that 198,000 tons of zinc (54,000 tons less than in 1937) were used in 1938 in zincking (galvanizing) sheets, forms, tubes, wire, and other products.

*Secondary tin.*—Secondary tin recovered amounted to 23,610 tons valued at $19,284,648 in 1938 compared with 30,300 tons valued at $32,124,100 in 1937. The total value assigned is based on the yearly average price (40.84 cents in 1938 and 53.01 in 1937) given by the American Metal Market for 99-percent metal, prompt delivery at New York.

Figures for recovery of pig tin for earlier years are not comparable with 1936, 1937, and 1938, as all tin recovered at tin-plate plants by

Digitized by Google

operators by treating tin scruff was eliminated beginning in 1936. This tin is recovered in the ordinary course of operations at nearly all plants, and its elimination decreased 1936, 1937, and 1938 totals about 2,000 tons. The tin recovered in alloys and chemical compounds decreased 3,320 short tons in 1938. Secondary tin recovered in 1938 was equivalent to about 42.4 percent of the tin imported into the United States as pig metal in 1938.

According to reports to the Bureau of Mines, 1,510,502 long tons of tin plate and terneplate were made in 1938. It is estimated that about 25,567 long tons of tin were used in these products and that 3,921 short (3,502 long) tons of tin were recovered from tin-plate clippings and old coated containers.

Owing to the relatively high value of tin, it is important that the degree of accuracy be high in obtaining representative samples of shipments of tin dross and in analyzing them later.[9]

Many earlier chapters of this series contain data on plants and processes followed, and a complete history of the different methods of detinning has been published by Mantell.[10]

The rules of procedure governing issuance of licenses for exportation of tin-plate scrap during 1939 were released by the Department of State on December 16, 1938. Allotments will be based on each individual producer's request therefor, with the provision that no allotment of more than 25 long tons shall exceed 20 percent of the tin-plate scrap produced by him during the calendar year 1937. No allotment to any producer shall exceed 2,000 tons. Export quotas for 1938 were based on 25 percent of 1937 production, and a total of 15,000 tons was assigned. In all, 187 licenses actually were issued authorizing the exportation of 13,237 tons of tin-plate scrap valued at $226,728.47. All licenses issued during 1938 named Japan as the country of destination.

H. R. 5840 (76th Congress) proposes to extend the licensing feature of the Faddis-Barbour Law to "other scrap, drosses, or residues, the tin content of which is in excess of 10 per centum in which the copper content does not exceed the tin content." This bill passed the House of Representatives on May 1, 1939. Details of other Government action affecting tin and a discussion of the national defense aspects of tin are given in the Tin chapter of this volume.

Notwithstanding the fact that the price of tin decreased about 12 cents a pound in 1938 some old tin-coated containers were treated at detinning plants, although the quantity decreased about 1,800 long tons. Many more old cans could be treated at existing plants, but collections are restricted to areas adjacent to the plants because of the cost of collecting, shipping, and cleaning such bulky material. A large quantity of old cans is disintegrated at Los Angeles and used at copper mines in Utah and other States, but no attempt is made to recover the tin coating.

| Tin imported as metal | 85,152 | 98,689 | 55,663 |
| Tin concentrates (tin content) imported | 200 | 169 | (1) |

[1] Less than 1 ton.

The quantity of tin-plate clippings treated at detinning plants decreased about 28,250 long tons in 1938, and the average cost of such clippings delivered at plants decreased from $19.38 a long ton in 1937 to $11.42 in 1938. These clippings were treated at plants of the Vulcan Detinning Co. at Sewaren, N. J., Neville Island, Pa., and Streator, Ill.; of the Johnston & Jennings Co. at Cleveland, Ohio; and of the Metal & Thermit Co., at South San Francisco, Calif., East Chicago, Ind., and Chrome, N. J.

Imports of tin-plate scrap in 1938 totaled 10,444 long tons valued at $81,685 compared with 12,916 tons valued at $179,459 in 1937. Of these amounts, Canada supplied 11,881 tons valued at $170,925 in 1937 and 10,682 tons valued at $74,658 in 1938.

Exports of tin-plate scrap decreased from 14,126 long tons valued at $246,770 in 1937 to 12,495 tons valued at $227,874 in 1938. Japan took all the exports in 1937 and 1938. This material would yield Japanese detinners about 35 pounds of tin per long ton.

Exports of waste tin plate decreased from 26,259 long tons valued at $2,022,955 in 1937 to 7,255 tons valued at $474,689 in 1938, of which Japan took about 71 percent in 1937 and about 16 percent in 1938.

The tin reported recovered in alloys and compounds in 1938 included the tin content of products made from clean tin-plate scrap. Most of the tin recovered at the plants listed was in sodium stannate, tin crystals, tin tetrachloride, and tin oxide.

The total recovery of tin as metal or in compounds from clean tin-plate scrap in 1938 was 3,881 short tons, whereas it is estimated that makers of tin plate and terneplate consumed nearly 24,552 long tons of tin. Some old tin-coated containers treated at Chrome, N. J., yielded 27.3 pounds of tin per long ton.

*Secondary aluminum.*—The recovery of secondary aluminum, including that in alloys, totaled 38,800 short tons valued at $15,326,000

Digitized by Google

compared with 62,560 tons valued at $23,773,000 in 1937. The value in 1937 was computed at 19 cents a pound and in 1938 at 19.75 cents a pound.

The value of primary aluminum produced in the United States increased from $55,609,000 in 1937 to $56,659,000 in 1938.

| | 1937 | 1938 |
|---|---|---|
| Primary aluminum produced in the United States | 292,681,000 | 286,882,000 |
| Aluminum (crude and semicrude) imported for consumption | 45,178,069 | 17,740,281 |
| Aluminum (crude and semicrude) exported | 5,383,516 | 12,618,078 |

Prices for scrap cast aluminum ranged from 9.37 cents a pound in January to as low as 4.62 cents in June. New aluminum clippings had a spread of 2.5 cents a pound in 1938, ranging from 14 cents in January to a low of 11.5 cents in June. Demand was sagging and prices were low from April to August. Scrap-aluminum clippings remelted in the ordinary course of shop practice were excluded from 1938 recoveries wherever possible. About 400 tons of aluminum clippings were purchased by makers of metallic powders in 1938. These pure clippings are the most suitable material for this purpose, but frequently it is difficult to purchase them, for a large quantity is remelted and rolled into sheet aluminum.

A progress report of the Aluminum Research Institute by its secretary, R. D. T. Hollowell,[11] gives the following interesting information, which is abstracted from that report:

Just as long as satisfactory secondary aluminum is produced at prices that compare favorably with those paid for primary metal it is unprofitable for foundrymen to use virgin metal if secondary metal will produce equally good results.

Prior to about 1916 the chemical composition of secondary aluminum ingot was governed almost entirely by the chemical composition of the scrap from which it was made. Pure clippings and sheet scrap (which in those days was pure) were commonly added to reduce the percentage of impurities but the impurities were not eliminated. Fluxing was practiced in the heating of the dross so that it could be more easily separated from the bath of molten metal. Prior to 1924 the scrap aluminum that came on the market was chiefly No. 12 casting alloy, which contained 92 percent aluminum and 8 percent copper. Aluminum sheet in those days was about 99 percent pure.

New aluminum alloys were soon developed. Manganese was one of the early elements to be added to aluminum. Then came silicon and more complex alloys with magnesium. Today, we find aluminum alloys containing one or more of the following alloying elements: Nickel, manganese, silicon, lead, tin, titanium, chromium, and magnesium. Beryllium, calcium, lithium, and sodium were also introduced into aluminum alloys. Of late, the increased use of magnesium castings has further complicated the problem due to the fact that it is difficult to distinguish magnesium from aluminum castings by appearance only. Today, certain

Digitized by Google

grades of nonmagnetic stainless steels stray into the aluminum scrap and make sorting still more difficult.

In order to keep pace with the introduction of all these different alloys, the successful "remelter" was forced to develop into a refiner. In order to produce secondary metal with known properties and definite analysis, he found it necessary to operate chemical and metallurgical laboratories.

Not only does the laboratory of an up-to-date aluminum refiner obtain exact chemical analysis of the scrap and finished ingot, but it also checks the finished metal for tensile strength, elongation, hardness, impact resistance, and other physical properties.

The modern smelter maintains an experimental foundry in which the fluidity and shrinkage of the ingot are determined before shipping to a customer. Intricate designs are poured to check foundry quality. Castings are poured at high temperatures to determine freedom from stain or discoloration.

The results obtained from these more or less routine tests taught the modern smelter that, in order to obtain uniformity, he must of necessity remove some of the harmful impurities—in other words, he must truly refine the metal. It is with a great deal of pride that the Aluminum Research Institute now reports that its members remove not only oxides, nonmetallic inclusions, and gases, but also free the aluminum from certain alloying elements which interfere with foundry properties and which mar the appearance of the finished castings.

This progress in refining practice is due in no small measure to the maintenance by the leading refiners of true research laboratories—laboratories quite divorced from routine analysis and plant control. The equipment in some of these laboratories compares favorably with the metallurgical equipment maintained by manufacturers in other important fields.

There was a time when consumers thought that secondary aluminum was distinctly inferior to virgin metal, and that, consequently, it could not be used for their more exact requirements. Today, secondary aluminum manufactured by a responsible smelter who maintains complete laboratory service, can be satisfactorily used for almost any purpose where primary metal is regularly employed. This does not mean that secondary metal, irrespective of composition and quality, can be substituted for good grades of primary metal. It does mean that secondary metal of the required composition, properly made and refined, is metallurgically equivalent to primary aluminum in every respect.

The complexity of the aluminum scrap that is coming on the market today is the reason why most up-to-date foundries have either discontinued entirely, or soon will be confronted with the necessity of discontinuing, the use of scrap aluminum. For the last year or two, it has been almost impossible for the foundryman to buy pure aluminum in the form of clippings. Practically all clippings are comingled with alloy clippings, such as duraluminum and others. Cast aluminum is still being purchased and used as scrap by some of the smaller foundries. The increased number of casting alloys now used makes it more and more difficult for the average foundry to duplicate the refining process followed by the modern secondary aluminum manufacturer, unless the foundry is able to buy in tremendous quantities and put in its own control laboratories for checking raw materials and finished products.

Ever since its organization, the Aluminum Research Institute has endeavored to standardize the alloys most commonly used by aluminum foundries. In cooperation with the National Association of Waste Material Dealers, the Institute published standard purchase specifications for all grades of aluminum scrap. These have been accepted as standard by the entire aluminum industry.

One of the greatest services the Institute has rendered to the industry lies in the field of chemical analysis. When the industry was in the purely "remelt" stage, little attention was paid to chemical analysis. Later, however, the necessity for laboratory control led to the discovery that the analysis of the same alloy made by different laboratories did not check. When, in the case of a dispute, an outside chemist was called in, his analysis was often quite different from all the others. The result was frequent disputes, losses through rejections of material, and unsatisfactory dealings between the smelter and his customers.

At one of the early meetings of the Institute, it was decided to prepare a standard check sample to see how our own laboratories checked with each other. When member laboratories reported widely varying results, something had to be done. The Aluminum Company of America had previously prepared standard methods of analysis, but these methods, while well fitted to alloys made of new metals of high purity, were not always satisfactory for analyzing the more complex and comingled secondary alloys.

Digitized by Google

The Institute, after several years of painstaking work, prepared standard methods of analysis for secondary aluminum. In 1932 these methods were published and widely distributed. By their use, check results were obtained. The chemists committee of the Institute, responsible for these methods, has continued its work. Many carefully prepared samples have been distributed for check and standardization purposes. Many new methods have been tried out. Many important changes have been made in the original analytical methods. New improved methods are now being prepared for publication and will soon be ready for distribution to those interested.

The Aluminum Research Institute is preparing and plans to have available about July 1 standard samples of secondary aluminum of known chemical analysis. These samples will be sold at cost to any laboratory interested in aluminum and may be used for check purposes.

The Aluminum Research Institute has taken the lead in the last few years in developing specifications for certain grades of secondary aluminum alloys. These specifications are rigidly adhered to by members of the Aluminum Research Institute, and they are in a position to furnish alloys to these specifications which will, when properly cast, show the physical properties indicated.

We wish to express our appreciation of the time you have so courteously extended to us. We pledge to you in the name of our Association members our unceasing efforts to continue to improve our product and to cooperate with you in the solution of your problems.

*Secondary antimony.*—The principal materials refined or remelted that contained antimony as an alloy were hard-lead drosses, babbitt, bearing metal, battery plates, pewter, and type metal. The antimony used in the pigment, paint, and ceramic industries is so dissipated that no secondary recoveries can be made, but a large proportion of the production of metal containing antimony returns in a few months or years for refining and reuse. Antimony in type metal and in bearings returns very rapidly for refining. This large return of scrap in type and bearing metals normally goes to the makers of type and bearing alloys, which restricts the market for antimonial lead. It may take several years for antimony in battery plates to return as scrap, but probably 80 to 85 percent is certain to come back for reuse in less than 3 years.

The production of secondary antimony in the United States, most of which was recovered in alloys, decreased in 1938. The average price for ordinary brands (Chinese grade) of antimony, as stated by the American Metal Market, was 12.35 cents a pound in 1938 compared with 15.35 cents in 1937. Smelters that ordinarily use primary ores, concentrates, or metal reported 2,080 tons of primary antimony and 729 tons of secondary antimony as contained in 24,123 tons of antimonial lead. The recovery of secondary antimony by secondary smelters decreased 3,716 tons.

Imports of antimony in ore, as metal, or in oxide were 7,116 tons less than in 1937.

*Secondary nickel.*—The nickel reported as recovered from secondary sources includes nickel in Monel metal (the natural alloy) but not that in ferrous alloys. The practice of using small quantities of nickel in iron and steel as well as in brasses and bronzes expanded greatly in both 1937 and 1938. Activity was much less at foundries in 1938. A large part of their products contained some nickel.[12]

Nickel often was substituted for tin to reduce costs in certain alloys requiring tensile strength and ductility.

Most of the secondary nickel recovered in 1938 came from scrap—nickel anodes, nickel-silver, copper-nickel alloys, and Monel metal. Exports of nickel scrap and scrap alloys containing nickel decreased. It is impossible to give the nickel content of all the exports of such nickel-bearing scrap, but the total nickel content reported by exporters who submitted data to the Bureau of Mines was 991 tons in 1937 and 870 in 1938.

Although the trend toward the use of nickel in iron and steel alloys increased in 1938, the secondary nickel recovered in ferrous alloys was undoubtedly less in 1938 than in 1937. Robert C. Stanley, president of the International Nickel Co., Ltd., estimates that about 42 percent of all nickel consumed in the United States is used in nickel iron and steel, mainly in motor cars, railway equipment, heat-resistant alloys, and machinery. Few of these industries expanded in 1938.

Probably more secondary nickel is recovered from ferrous than from nonferrous alloys, but no figures are available. Certain alloys give uninformed dealers trouble.[13]

Scrap iron and steel dealers frequently are careless in handling alloy ferrous scrap, and certain discarded equipment and automobile scrap that contain nickel are thrown in with the regular steel scrap instead of being kept separate and advantage taken of their greater value.[14]

## CLASSIFICATION OF OLD METALS

The classification of old metals drawn up by the Metals Division of the National Association of Waste Material Dealers, Inc., Times Building, New York, N. Y., and changed from time to time as desirable, is the standard of both dealers and manufacturers in the United States. The latest classification (Circ. M), effective March 16, 1932, was given in the Secondary Metals chapter, Minerals Yearbook, 1936. No immediate changes in this classification are contemplated.

There is a growing demand for scrap-metal specialties (not specifically covered by the classification), such as nickel alloys, German silver, Monel metal, cadmium, and molybdenum. Difficulties have arisen in making shipments to buyers' specifications, and with the object of eliminating some of the trouble the Waste Trade Journal published classifications used by one of its advertisers. A list of these was given on pages 338 and 339 of the Secondary Metals chapter in Mineral Resources of the United States, 1930, part I.

In presenting this new chapter of Minerals Yearbook attention is directed to the annual surveys on the consumption of ferrous scrap and pig iron in the United States beginning with 1935. The results of the 1935, 1936, and 1937 surveys have been published as separate reports.[1] In the canvass of consumers of ferrous scrap and pig iron, data are obtained only on scrap used in remelting processes. Material salvaged and reused in its original condition, or reshaped, is thus omitted from the survey.

Scrap has been divided into materials described as "home" and "purchased." The former includes scrap resulting from manufacturing processes, as well as old material produced at the plant reporting. As the name implies, the latter consists not only of scrap purchased from outside sources but also of scrap transferred from other plants under the same control and scrap received under exchange contracts or conversion agreements. No attempt has been made to differentiate between "old" and "new" scrap because ferrous-scrap accumulations contain both old and new material which is difficult to segregate statistically.

Although some concerns may utilize high proportions of old plant scrap for a limited period, in general the material included under the heading of home scrap largely represents recycled or run-around scrap and may be considered by many as merely rotating working stock rather than as actual consumption. However, this scrap constitutes a definite part of the furnace charges and must be included to obtain a complete picture of raw-material consumption in steel manufacture.

Ridgway, R. H., Davis, H. W., and Trought, M. E., Consumption of Ferrous Scrap and Pig Iron in the United States in 1936: Bureau of Mines Rept. of Investigations 3366, 1937, 21 pp.; Consumption of Ferrous Scrap and Pig Iron in the United States in 1937: Bureau of Mines Rept. of Investigations 3420, 1938, 22 pp.

Digitized by Google

This is particularly applicable as long as ingot production (which includes a large part of this recycled scrap) remains the yardstick for measuring activity in the steel industry.

## GENERAL SUMMARY

Consumption of scrap iron and scrap steel in the United States decreased sharply in 1938 from that in 1937 owing to the low rate of industrial production. Prices received little support from the domestic market during the first part of 1938 and, as foreign demand weakened, reached the low point of the year in June. At that time foreign purchasers again entered the market, but prices did not react sharply until the latter part of July following improvements in the domestic market occasioned by the increasing rate of industrial production which began early in that month. The higher price levels reached early in the last quarter were maintained until the close of the year.

Exports of ferrous scrap from the United States dropped 27 percent in 1938 compared with 1937. However, the tonnage and value of the exports in 1938 were second only to those in 1937, when record shipments were made. Consignments of scrap from the United States to Japan, the United Kingdom, Poland, and Canada were curtailed sharply in 1938, but those to Italy, Germany, and the Netherlands showed a marked gain.

The question of the embargo on exports of scrap iron and scrap steel (S. 2025, 75th Cong.), which was raised in 1937 when prices and world production of steel were skyrocketing, received little support in 1938, with the result that the bill was allowed to die in committee. However, similar bills were introduced in the Seventy-sixth Congress early in 1939.

The importance of scrap from the standpoint of conservation is illustrated by the relative quantities of scrap and ore used in the domestic iron and steel industry. The total scrap consumed in 1938 was equivalent to 132 percent of the iron content of all domestic and foreign iron and manganiferous iron ores used in blast furnaces, and purchased scrap alone equaled 62 percent of the iron content of the ores; in 1937 the comparable percentages were 119 and 57.

The total consumption of ferrous scrap and pig iron in 1938 decreased 45 percent from 1937, as shown in the following table. Of the 39,849,283 gross tons used, 31,350,025 tons were charged to steelmaking furnaces and 8,499,258 tons to iron furnaces. In making the average ton of steel in 1938 more scrap and less pig iron were used than in 1937; a decline in the relative use of purchased scrap was more than offset by an increase in the relative use of home scrap. In iron furnaces the relative use of purchased scrap increased, that of home scrap changed little, and that of pig iron decreased.

[1] Includes open-hearth, bessemer, and electric furnaces.
[2] Includes cupola, air, Brackelsberg, puddling, crucible, and blast furnaces; also direct castings.

The following table shows that scrap constitutes by far the greater part of the raw materials used in the Southwestern, Pacific Coast, and New England districts. These regions, however, used less than 6 percent of the total scrap consumed in 1938. Except for the Southeastern district, proportionately more scrap was used in all areas in 1938 than in 1937, although most of the increases were relatively small. Apparently, lower prices for scrap explained much of the increase in 1938, especially in outlying areas.

*Total ferrous scrap and pig iron consumed in the United States and percentage of total derived from home scrap, purchased scrap, and pig iron, 1937–38, by districts*

Figure 1 shows consumption of purchased scrap and output of pig iron and steel ingots and castings from 1905 to 1938, inclusive.

Open-hearth steel furnaces use by far the largest quantities of ferrous scrap and pig iron. They consumed 68 percent of the total scrap in 1938 (69 percent in 1937), 70 percent of the home scrap (70 percent in 1937), 66 percent of the purchased scrap (69 percent in 1937), and 74 percent of the pig iron (74 percent in 1937).

Cupolas, the second largest consumers of scrap, took 24 percent of the purchased scrap in 1938 compared with 20 percent in 1937. They increased slightly their relative consumption of home scrap (15 percent) and pig iron (13 percent).

Open-hearth and cupola furnaces together consumed 85 percent of the home scrap, 90 percent of the purchased scrap, and 87 percent of the pig iron in 1938. Bessemer converters used 11 percent of the pig iron consumed in 1938 but only relatively small quantities of scrap (0.54 percent of the total). Although electric furnaces consumed only 4 percent of the scrap in 1938, 98 percent of the total charge to this type of equipment was home and purchased scrap.

*Consumption of ferrous scrap and pig iron in the United States, 1937–38, by type of furnace, in gross tons*

| Type of furnace or equipment | Active plants reporting | Scrap | | | Pig iron |

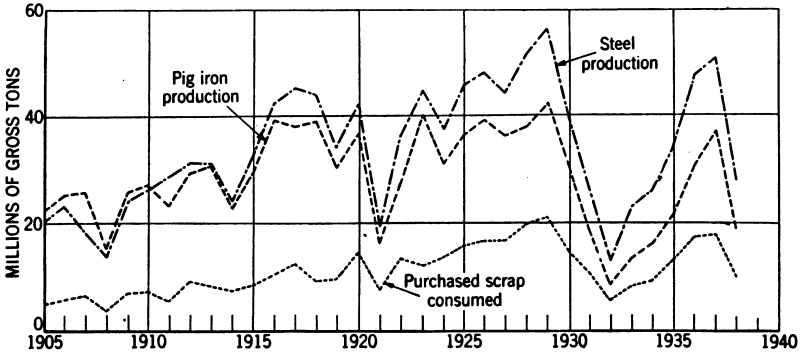

FIGURE 1.—Consumption of purchased scrap and output of pig iron and steel in the United States, 1905–38. Figures on consumption of purchased scrap for 1905–32 are from *State of Minnesota* vs. *Oliver Iron Mining Co. et al.*, Exhibits, vol. 5, 1935, p. 328; those for 1933–34 are estimates by author; and those for 1935–38 are based on Bureau of Mines reports. Figures on output of pig iron and steel are as given by the American Iron and Steel Institute.

## PRICES [2]

Average prices of scrap iron and scrap steel in 1937 reached the highest levels since 1923 but had fallen off approximately 37 percent by the close of the year and fell still lower in 1938. The average price of No. 1 heavy-melting steel at Pittsburgh declined from $14.25 per gross ton at the beginning of 1938 to $11.30 the middle of June, then rose to $15.75 at the close of the year. No. 1 cast cupola scrap declined from an average of $16.25 at the beginning of 1938 to $13.45 in June, then rose to $15.50 by October where it remained to the end of the year. The price of basic pig iron, established at $23.50 per gross ton at Valley furnaces in April 1937, prevailed until late in June 1938, at which time it dropped to $19.50; in late September the price rose to $20.50 where it stood throughout the last quarter of the year.

[2] Price quotations from The Iron Age.

## LEGISLATION

During the first half of 1938, when the trends of industrial activity and demand for scrap were downward, interest in scrap iron and scrap steel centered largely in the proposed embargo on exports. Senator Schwellenbach's bill (S. 2025, 75th Cong.) to restrict foreign shipments of ferrous scrap was patterned after the Faddis-Barbour bill (Public Law, 448, 74th Cong.), which prohibits exports of tinplate scrap, waste-waste, strips, cobbles, etc., except under license issued by the President. Final hearings on S. 2025 were held in April 1938 before a subcommittee of the Committee on Military Affairs of the United States Senate. Extensive testimony was presented on both sides.[3] Pressure for the passage of the bill moderated after the slump in steel production and scrap prices which took place late in 1937 and early in 1938, and the bill died in committee. Further consideration of the proposal, however, is assured.

## CONSUMPTION BY DISTRICTS AND STATES

All 48 States, the District of Columbia, and Alaska contain plants consuming ferrous scrap or pig iron. The greatest consumption, however, is concentrated in the steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas include the eight largest consuming States, which used 81 percent of the total scrap, 91 percent of the pig iron, and 85 percent of the total scrap and pig iron charged into furnaces in 1938. These States and the percentage of the total ferrous scrap and pig iron each consumed in 1938 were as follows: Pennsylvania 24, Ohio 21, Indiana 11, Illinois 8, Michigan, 6 Alabama 6, New York 5, and Maryland 4.

## CONSUMPTION BY TYPE OF FURNACE

*Open-hearth furnaces.*—The total ferrous scrap and pig iron consumed in open hearths was 28,337,001 gross tons in 1938, a decrease of 45 percent from 1937. Of the 1938 total, home scrap comprised 28 percent, purchased scrap 24 percent, and pig iron 48 percent; in 1937 the percentages were 27, 24, and 49, respectively. The use of home scrap decreased 43 percent, purchased scrap 47 percent, and pig iron 45 percent.

Digitized by Google

Charges to open-hearth furnaces consisted of 52 percent total scrap and 48 percent pig iron in 1938 compared with 51 and 49 percent, respectively, in 1937. Of the total scrap consumed in open hearths in 1938, 46 percent was purchased scrap compared with 47 percent in 1937 and 48 percent in 1936. Higher proportions of purchased scrap are used in areas remote from pig-iron producing centers. The practice of using scrap exclusively is relatively rare. In 1938 only 4 plants out of a total of 135 operated on a 100-percent-scrap basis; they consumed only 252,737 tons, less than 1 percent of the total consumption of ferrous raw materials in open hearths.

Pennsylvania, the leading steel producer, outranked all other States in 1938 in the consumption of ferrous scrap and pig iron in open hearths, followed by Ohio, Indiana, and Illinois.

*Bessemer converters.*—The consumption of ferrous scrap and pig iron in bessemer converters totaled 2,061,494 gross tons in 1938, a decrease of 47 percent from 1937. The proportion of scrap consumed in converter practice is low, amounting to only 5.6 percent in 1938, and virtually the entire quantity was home or plant scrap. All the small tonnage of purchased scrap consumed in converters was used in small steel-foundry plants.

Ohio was the principal consumer of scrap in bessemer converters in 1938.

[1] Revised figures.

*Electric steel furnaces.*—Ferrous scrap and pig iron consumed in electric furnaces totaled 951,530 gross tons in 1938, a decrease of 46 percent from 1937. Pig iron comprised less than 2 percent of the total ferrous raw materials used in electric furnaces in 1938. Of the 257 active plants reporting in 1938, 96 operated exclusively on scrap and consumed 201,906 tons, or about 21 percent of the total scrap and pig iron used.

Ohio led all States in consumption of scrap in electric furnaces in 1938, followed by Pennsylvania, Illinois, Michigan, and California.

[1] Revised figures.
[2] Revised to include 925 tons of home scrap, 1,499 tons of purchased scrap, and 3 tons of pig iron from Texas previously included under cupola furnaces.

Digitized by Google

*Cupola furnaces.*—Consumption of ferrous scrap and pig iron in cupola furnaces in 1938 totaled 6,596,539 gross tons, a decrease of 38 percent from 1937. Use of home scrap decreased 40 percent, purchased scrap 32 percent, total scrap 36 percent, and pig iron 43 percent. Thus the proportion of purchased scrap more than held its own; however, the relatively low price of scrap compared with pig iron was undoubtedly an important factor.

Charges to cupola furnaces in 1938 contained 26 percent home scrap, 37 percent purchased scrap, and 37 percent pig iron; in 1937 the percentages were 27, 34, and 39, respectively. Many cupola plants operate on 100-percent scrap charge, and 421 plants reported the consumption of 595,090 gross tons of ferrous scrap without the use of pig iron in 1938.

Michigan continued as the principal consumer of scrap in cupola furnaces in 1938, but the position of other States changed; Ohio, Pennsylvania, Illinois, and New York followed in decreasing order.

*Consumption of ferrous scrap and pig iron in cupola furnaces in the United States in 1938, by districts and States, in gross tons*

| 1937 | [1] 2,611 | [2] 2,878,395 | [2] 3,629,078 | [2] 6,507,473 | [2][3] 4,195,234 |

[1] Revised figures.
[2] Revised to include 12,180 and 634 tons of home scrap, 1,930 and 457 tons of purchased scrap, and 58,497 and 472 tons of pig iron in West Virginia and Texas previously included under air furnaces and to exclude 925 tons of home scrap, 1,499 tons of purchased scrap, and 3 tons of pig iron from Texas now included under electric furnaces.
[3] Includes some pig iron used in making direct castings.

*Air furnaces.*—Ferrous scrap and pig iron consumed in air furnaces amounted to 610,726 gross tons in 1938, a decrease of 49 percent from 1937. The use of both home and purchased scrap decreased 43 percent and that of pig iron 58 percent. Thus, equipment of this type used relatively less pig iron than purchased scrap in 1938. Only six operators of air furnaces reported exclusive use of scrap in 1938, the quantity consumed amounting to 112,554 tons.

Ohio led in scrap consumption in air furnaces in 1938, followed by Indiana, Illinois, Wisconsin, and Pennsylvania.

[1] Includes 2 Brackelsberg furnaces, 1 each in Indiana and Ohio in 1938, and 1 each in Michigan and Ohio in 1937.
[2] Revised figures.
[3] Revised to exclude 12,180 and 634 tons of home scrap, 1,930 and 457 tons of purchased scrap, and 58,497 and 472 tons of pig iron in West Virginia and Texas now included under cupola furnaces.

*Crucible and puddling furnaces.*—Crucible and puddling furnaces, whose combined output of iron and steel is very small, consume only minor quantities of ferrous raw materials, as the following table shows.

| 1937 | 20 | 5,366 | 7,200 | 12,566 | 31,532 |

*Blast furnaces.*—Ferrous scrap constitutes only a small proportion of the metal-bearing materials consumed in blast furnaces. The other materials used in 1938 were 32,373,834 gross tons of iron and manganiferous iron ores, 2,271,055 tons of cinder and scale, and 951,000 tons of flue dust. Total consumption of scrap in 1938, as reported by 71 plants operating blast furnaces, was 1,064,410 tons, a decrease of 55 percent from 1937. Of the 1938 total, 72 percent was home scrap and 28 percent purchased scrap.

The proportion of scrap used in blast furnaces again declined in 1938, amounting to 5.7 percent of the pig iron produced in 1938 compared with 6.6 percent in 1937 and 6.9 percent in 1936. Purchased scrap was equivalent to 1.6 percent of the pig iron produced in 1938 compared with 2.5 percent in 1937 and 3.0 percent in 1936.

Blast furnaces in Ohio continued to consume more scrap in 1938 than those in any other State.

## FOREIGN TRADE [4]

*Imports.*—Imports of iron and steel scrap into the United States, which are not of any great significance, amounted to 24,451 gross tons valued at $281,240 in 1938 compared with 81,640 tons valued at $1,153,206 in 1937. In addition, 10,444 tons of tin-plate scrap were imported in 1937, largely from Canada; 1938 receipts totaled 12,916 tons.

*Exports.*—Ferrous-scrap exports (all types) from the United States continued on a large scale in 1938. However, the tonnage and value decreased sharply from the record shipments of 1937. A total of 2,998,607 gross tons, valued at $45,833,916, was exported in 1938 compared with 4,101,549 tons, valued at $79,387,459, in 1937. The shipments included 24,216 tons of tin-plate scrap, waste-waste, strips, cobbles, etc., valued at $902,607 in 1938 compared with 53,447 tons, valued at $2,824,293, in 1937. The following table shows the principal countries to which shipments of scrap were consigned during the 5-year period, 1934–38.

| United Kingdom | 134,434 | 277,366 | 364,874 | 847,177 | 387,347 |
| Other countries | 110,597 | 179,922 | 122,119 | 268,738 | 113,601 |
| Total value | 1,835,170 | 2,103,959 | 1,936,132 | 4,101,549 | 2,998,607 |
| | $19,187,858 | $22,949,070 | $24,684,084 | $79,387,459 | $45,833,916 |

Of the total exports of ferrous scrap from the United States in 1938, 1,769,611 gross tons cleared through customs districts on the Atlantic coast (2,221,689 tons in 1937), 779,613 tons from districts bordering the Gulf of Mexico (1,389,828 tons in 1937), 368,842 tons from districts along the Pacific coast (342,707 tons in 1937), and 80,541 tons from other customs districts (147,325 tons in 1937).

Exports have been drawn largely from seaboard areas where the cost of transportation from the point of origin to the port of exportation is relatively low and where the cost of transportation to domestic iron and steel plants not within the area is often prohibitive.

## WORLD ASPECTS

The great demand for scrap in steel-making in recent years has encouraged the intensive reclamation of scrap in all countries. In fact, several countries, including Germany, the United Kingdom, Japan, and Italy, have officially sanctioned campaigns to encourage the collection and utilization of scrap from all possible sources.

World requirements of scrap abated somewhat in 1938 because of a slowing down of steel production. According to Metal Statistics world production of steel ingots totaled 107,000,000 gross tons in 1938, a drop of 19 percent from the 132,500,000-ton record of 1937. The greater part of this decrease, however, occurred in the United States, and if this country is excluded world production fell only 4 percent from the 1937 levels.

In countries seeking self-sufficiency every effort is being made to increase the production of pig iron from domestic raw materials and thereby reduce the proportions of scrap used in steel-furnace charges. However, demand for steel has exceeded the growth of pig-iron production, with the result that scrap has been imported by these countries in ever-increasing quantities.

*Cartel activities.*—On March 11, 1937, producers of steel in 10 European countries organized a scrap-buying cartel for the purpose of purchasing and distributing scrap moving in international trade. Cartel members agree to buy all foreign scrap through the cartel's representative, the British Iron and Steel Federation in London. According to a report [5] the cartel bought 1,468,000 gross tons of scrap from the United States in 1938 and then divided the tonnage among its members. Italy, the leading European scrap importer, and the United Kingdom have taken much the largest part of the cartel's purchases.

Digitized by Google

Early in 1938 the Seiko Genryo Kowakai (Steel Materials Conference) decided upon a purchasing policy for the last half of 1938.[6] It was agreed that when steel makers who are not members of the conference desire to purchase scrap iron and scrap steel from the United States, specified as the major source of imports for Japan, such purchases should be entrusted to the conference which will make the purchase through its specified agent, Rokuyokai.

## REVIEW BY COUNTRIES

*Germany.*—From 1930 to 1932, inclusive, Germany exported scrap iron and scrap steel but since then has imported it, taking larger quantities each year. Efforts have been made to conserve domestic scrap by increasing the amount of pig iron used in steel-making furnaces, and the drive for self-sufficiency has centered largely on the subsidized development of low-grade iron ores, inasmuch as Germany at present produces only about 50 percent of the ferrous raw materials, including scrap, required by its industry.[7] In 1938, partly owing to the acquisition of Austria and the Sudetenland from Czechoslovakia, Germany for the third successive year established a new record in steel production, by which that nation ranks second to the United States. However, the annexation of Austria and the Sudetenland has not enhanced Germany's position particularly, as the annual production of these territories is relatively small and in the past both have imported ferrous raw materials. Extensive propaganda to arouse the public to an understanding of the value of old materials has been decidedly successful. German municipalities having a population of more than 35,000 are obliged to sort and salvage old materials from refuse.

*Italy.*—In 1938 Italy regained its position among European nations as the largest importer of scrap iron and scrap steel from the United States, this country having supplied 66 percent of the total Italian imports in that year. Scrap is the principal ferrous raw material imported into Italy. Italian iron mines produce only about 35 percent of the requirements of the steel industry, and the rest is supplied largely by scrap imported from the United States and France and by domestic scrap. Application of sanctions against Italy in 1935 acted as an incentive toward greater self-sufficiency; and scrap imports, which exceeded 1 million tons in 1935, were reduced to less than one-half that figure by the end of 1938.[8]

*Japan.*—The production of steel ingots and castings in Japan has more than doubled since 1932, and the demand for ferrous raw materials has increased correspondingly. Pig-iron production has been expanded to meet part of the requirements; however, the proportions of scrap used in furnace charges also have increased, and imports of scrap iron and scrap steel are essential to the maintenance of the present steel-making rate. Early in 1938 the Japanese Department of Finance considered restricting imports of scrap and pig iron in order to balance the country's international account and tentatively set 1938 imports at one-half the 1937 total; thus the 1938 imports of scrap

Digitized by Google

would amount to about 1,500,000 metric tons.[9] Japanese military successes in China stabilized her credit in the fall of 1938. As a result, large orders for scrap iron and scrap steel were immediately placed with foreign suppliers. The United States is by far the leading source of imports of scrap into Japan. Heavy European demand and embargoes on exports of scrap in countries from which stocks might otherwise have been obtained have increased the share supplied by the United States. No other country has furnished Japan with as much as 10 percent of its total imports of scrap in recent years.

*Poland.*—In recent years the trend in Poland has been toward increasing the proportion of domestically produced pig iron used in steel making and thus minimizing the necessity of importing large tonnages of scrap iron and scrap steel. In 1938 imports of scrap dropped to approximately 390,000 gross tons, or 28 percent below the 1937 imports of 540,000 tons.[10] Expansion of blast-furnace capacity in Poland, as well as acquisition of the Trans-Olzan area from Czechoslovakia, is largely responsible for the reduction in Poland's imports of scrap. The addition of the Trans-Olzan area will increase Poland's annual pig-iron production by 500,000 tons or 55 percent and her steel output by 750,000 tons or 50 percent, thus satisfying Poland's most pressing need of steel for national defense.[11]

*United Kingdom.*—Abnormally large stocks of imported scrap iron and scrap steel on hand and on order in the United Kingdom in 1937, when demand for finished steel products suddenly disappeared, resulted in a sharp decrease of imports in 1938. The oversupplies, purchased largely in 1937, impeded the progress of domestic collectors of scrap in 1938 and brought severe censure of the British Iron and Steel Federation.[12] To meet the distress of the scrap merchants it was suggested that the British steel trade should stock all offered tonnages of home-collected scrap material to keep conditions fluid for the scrap industry.[13] Export restrictions, agreed upon by the scrap and steel industries in 1937, were removed, but the export prices placed much of the business out of reach of British merchants. However, special arrangements were made to sell surplus material to foreign buyers, and exports increased during the closing months of 1938.

| Foreign trade | 572 |

World production of iron and steel in 1938 receded from the record established in 1937 but was still at a high level. Although the total world figure shows the effects of this drop, the bulk of the decline took place in the United States. Foreign producers, stimulated by war conditions, heavy armament activities, and frantic attempts at national self-sufficiency, continued operations on a scale that was, in general, only slightly below the record levels of 1937; in fact, new production peaks were established in some countries, notably Germany, Italy, Japan, and the U. S. S. R. Some of the gain in Germany was due to territorial accession during 1938, but production in that country even as formerly constituted advanced. Output in Belgium, France, and Great Britain was off in 1938. World output of pig iron and steel each fell 20 percent in 1938 compared with 1937; American production dropped 48 and 44 percent, respectively, and the rest of the world only 4 and 5 percent. Of the total world putput of pig iron and steel in 1938 the United States furnished about 24 and 27 percent, respectively—the lowest proportionate share in more than half a century.

The domestic iron and steel industry in 1938 followed a pattern almost the reverse of that in 1937, and production was at a low level. As a result of sharply curtailed operations in the last quarter of 1937, the year opened with a low operating rate which persisted during the first 6 months. There was some improvement throughout the last half of the year, but the ground lost in 1937 was not regained. The

Digitized by Google

peak production was attained in November, when 62 percent of the steel capacity was employed compared with 90 percent in April, the peak month of 1937. At the close of 1938 operations were definitely on a larger scale than during the opening months; the average rate of production in the last quarter was 56 percent compared with 32 percent in the first quarter. The average operating rate for 1938 was 40 percent of capacity compared with 72 percent in 1937. The producers of such mineral products as iron ore, manganiferous iron ore, fluorspar, fluxing stone, and coke, which depend on iron and steel furnaces for their chief market, felt the lower demand in 1938. Domestic production of iron ore, the principal raw material, decreased 61 percent from 1937, was 56 percent below the 1925–29 average, and was the lowest since 1934. Figure 1 shows the trends in domestic production of iron ore, pig iron, and steel for more than half a century.

Although production of automobiles dropped 48 percent from 1937 to 2,489,635 units in 1938, the automotive

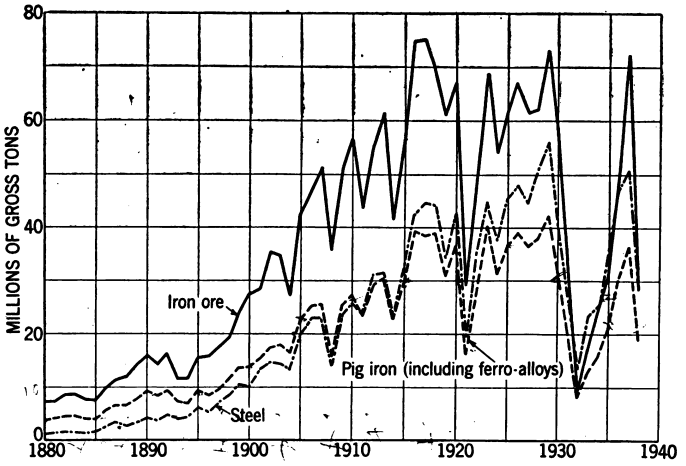

FIGURE 1.—Trends in production of iron ore, pig iron, and steel in the United States, 1880–1938.

industry remained the chief consuming outlet for steel, taking about one-sixth of the total. Agriculture had a good year, but prices of farm products were lower, resulting in an actual and relative decline in the quantity of steel moving into this outlet. Steel exported, though lower than in 1937, held up well and was more than double the quantity moving into agriculture. The relative quantities of steel used in containers were about the same in 1938 as in 1937.

The capital-goods industries continued the slump that began during the last quarter of 1937, less steel being demanded from this outlet. In periods of slack business activity, when large volumes of plant and equipment are idle, there is little incentive to expand existing facilities. Buying by the railroads was curtailed further by the drop in earnings during the year, particularly during the first two quarters, and purchases of all materials and equipment were more than 50 percent less than in 1937. New lightweight rolling stock designed for higher speeds has featured the railroad demand in recent years. Although this trend is more evident in the passenger branch, where high-speed,

Digitized by Google

streamlined trains are being featured, it also applies to freight-moving equipment.

The construction industry experienced a better year in 1938 than in 1937, resulting in a larger consumption of steel. Public construction expenditures, which increased during the latter part of 1938, more than made up for the recession in private construction, reversing the condition in 1937. There was a decided slump in industrial building in 1938, and commercial building construction dropped about 6 percent. Despite the increase in 1938 the industry was far below predepression levels.

Reversing the trend of recent years, the price of steel was reduced materially in 1938 (see fig. 2); large inventories and low demand accounted for the decline. Price reductions during the year on nearly all steel products brought down the composite price of finished steel, as compiled by Iron Age, to 2.255 cents per pound in October from 2.512 cents at the beginning of the year; for November and December the figure was 2.286 cents. The average for the year was 2.394 cents, the highest in any year since 1924, except 1937. Changes in the basing point system in 1938, including abandonment of the Chicago and Birmingham differentials, also affected prices. The radical change in the method of pricing and selling steel, a system of some 15 years standing, was the most noteworthy feature of the industry in 1938. Pig-iron prices reflected the light demand, and while quotations held during the first 5 months of the year, prices were cut $4 a ton in the third quarter but advanced $1 a ton for fourth-quarter delivery. The Iron Age composite pig-iron price was $20.61 a ton at the end of the year compared with $23.25 at the beginning of the year. Spiegeleisen and ferromanganese prices also declined. The change in quotations came at midyear, when ferromanganese dropped $10 a ton to $92.50 at seaboard, duty paid, and spiegeleisen $5 a ton to $28. Prices of scrap fluctuated, but not as widely as in 1937. The downward trend was reversed at midyear, and by the end of the year prices were at a higher level than at the beginning. The quotation on Lake ores for the 1938 season maintained the increase established in 1937, the first since 1929.

Employee relationships, which have been receiving increased attention in recent years, were not as important a factor in 1938 as in 1937. Decline in employment in the iron and steel industries was marked, owing to the low rate of activity; nevertheless, wage rates were unchanged. The contract entered into in March 1937 between the steel-manufacturing subsidiaries of the United States Steel Corporation and representatives of the Steel Workers Organizing Committee, one of the affiliates of the Congress of Industrial Organizations, as the collective bargaining agency for employees who were members of the Amalgamated Association of Iron, Steel, and Tinworkers of America, expired in February 1938. The agreement was renewed subject to change upon 10 days' notice from either party and to termination if changes are not agreed to within 20 days of the notice. This affords an opportunity of adjustment of operations to varying economic conditions. There were no major strikes in the iron and steel industries in 1938, although the Bureau of Labor Statistics, United States Department of Labor, lists 85 strikes beginning in 1938 involving 29,372 workers and resulting in 397,022 man-days idle during

Digitized by Google

the year. The wages-and-hours law, which provides a minimum of 25 cents per hour rate and a 44-hour week for the first year, became effective October 24, 1938, but the provisions of this act had little or no effect on the iron and steel industry.

Because steel making and finishing capacity is now physically able to take care of reasonable demands there was little addition to equipment in 1938. In many instances, the smaller returns from low operating rates necessitated lessened expenditure to conserve the cash position of the producer. However, some additional capacity was installed, resulting principally from the enlargement of present facilities, including a number of blast furnaces that were remodeled or relined. Two new blast furnaces, each of 1,000 tons daily capacity, were completed in 1938, one at Ecorse, Mich., and the other at Indiana Harbor, Ind. Eleven open-hearth furnaces (five at Indiana

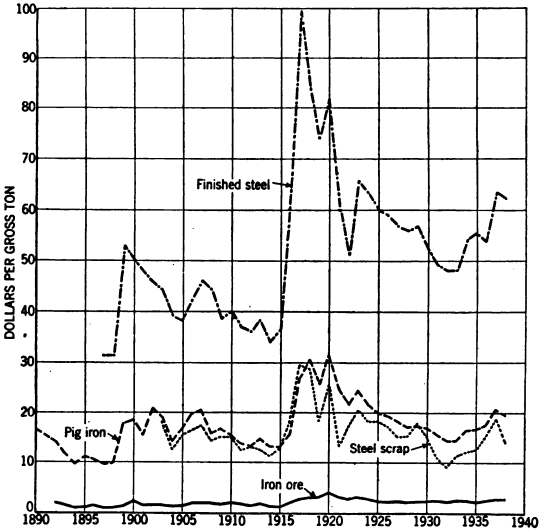

FIGURE 2.—Trends in prices of iron ore, pig iron, finished steel, and steel scrap, 1890–1938. The prices of iron ore and pig iron are the averages f. o. b. mines and furnaces, respectively, as reported to the Bureau of Mines; the price of finished steel is an average composite computed by American Metal Market; that of steel scrap is an average at Pittsburgh of No. 1 Heavy Melting, computed by Iron Age.

Harbor, Ind., four at Ecorse, Mich., and two at Gadsden, Ala.), with a total annual capacity of 931,300 tons, were completed in 1938. Capacity added to the finishing end of steel processes included completion of the Irvin works in the Pittsburgh district (Clairton) by the United States Steel Corporation.

Imports of iron ore into the United States decreased in 1938 from 1937 and comprised 7 percent of the domestic production, while imports of pig iron fell 73 percent and were only 0.2 percent of the domestic output. Imports of ferro-alloys also declined, but not so markedly, owing to the larger receipts of spiegeleisen and the comparatively smaller recession in ferromanganese. Imports of iron and steel manufactures, although relatively small, dropped abruptly in 1938 and were the lowest since 1921. Exports of iron and steel products were lower than in 1937 but still were at a good level; those

Digitized by Google

of pig iron likewise dropped but maintained much of the large increase of 1937, while those for iron ore, largely to Canada, declined 53 percent. Ferro-alloy exports also were lower but do not represent much tonnage. Exports of scrap, which have attracted considerable attention in recent years, receded from the all-time peak established in 1937 but were still at a high level.

Import duties on a number of iron and steel products were lowered in 1938 under the Trade Agreements Act of June 12, 1934. These changes were provided for in the new trade agreement with Canada signed November 17, 1938, and effective January 1, 1939, which superseded the agreement signed November 15, 1935. There were also some changes, including a reduction in the duty on low-phosphorus (0.04 percent or under) pig iron from $1.125 to $0.75 per long ton, in the trade agreement with the United Kingdom, which likewise was signed on November 17, 1938, to become effective January 1, 1939.

## CONSUMPTION OF FERROUS SCRAP AND PIG IRON

Data on the consumption of ferrous scrap, formerly included in this chapter, will be found elsewhere in this volume in the chapter on Scrap Iron and Steel. Data on consumption of pig iron will be found in the pig iron section of this report.

## IRON ORE

*Production and shipments.*—Domestic output of iron ore in 1938 decreased 61 percent from 1937 and was the lowest since 1934. The 1938 tonnage was 56 percent below the 1925–29 average. Of the 172 mines (this figure does not include an undetermined number of very small open-pit operations) 4 produced more than a million tons each compared with 205 mines that included 12 in the million-ton class in 1937. Sixteen States were active producers in 1938 compared with 18 in 1937. Shipments of iron ore, which decreased 63 percent, were the lowest since 1934 and 60 percent below the 1925–29 average. The bulk of the iron ore mined in the United States is used in the manufacture of iron and steel; but 58,747 tons of the ore produced in 1938 were used for other purposes, including the manufacture of cement (46,830 tons), paint (9,694 tons), flux at nonferrous smelters (1,846 tons), and hydrogen gas (377 tons).

The quantities of iron ore shown in the following tables include ore that was beneficiated—that is, treated in any way—as well as ore that does not require treatment. Although included in the figures on production, the iron ore sold for the manufacture of paint—9,694 long tons in 1938 valued at $44,249 ($4.56 a ton) compared with 8,375 tons in 1937 valued at $48,005 ($5.73 a ton)—is not included in the shipments from mines. The output of manganiferous ore that contained 5 to 35 percent manganese also is not included; 308,860 tons valued at $858,356 were shipped in 1938 compared with 1,340,972 tons valued at $3,857,768 in 1937. In Arkansas, one producer shipped 2 tons of loadstone, which is not included in the iron ore statistics. Moreover, the statistics do not include iron sinter recovered from the roasting of domestic pyrites concentrates in Tennessee.

*Principal mines.*—The importance of large mining units in the iron-mining industry is shown by the fact that 13 mines, yielding more than 500,000 tons each, produced about half of the entire output in 1938. This situation, however, was not as pronounced in 1938 as in a year of heavy demand. In 1937, for example, a year of near-record output, 75 percent came from mines yielding 500,000 tons or more. In 1938, four operations—two in Minnesota, one in Alabama, and one in Pennsylvania—produced more than a million tons each compared with 12 in 1937. Of the 13 principal producing mines in 1938, 8 were open pits, 3 were operated by underground methods, and 2 were combination. Except for one mine that produced magnetite all other principal mines produced hematite.

[2] Output of 2 mines producing less than 50,000 tons each included with output of mines producing more than 500,000 tons each.
[3] Excludes an undetermined number of small pits. The output of these pits is included in the tonnage given.

*Beneficiation.*—Beneficiation of iron ore was reported at 43 mines in seven States in 1938 compared with 64 mines in six States in 1937. At many mines the ore is crushed and screened to improve its structure, but ore so improved is not included in the statistics of beneficiated ore. Some iron ore is recovered in the form of dust from blast furnaces; data on ore so recovered, however, have been accounted for previously in shipments from mines.

Beneficiated ore shipped from domestic mines in 1938 decreased 61 percent from 1937 and comprised 18 percent of the total shipments in 1938 compared with 17 percent in 1937.

The quantity of crude ore beneficiated in the Lake Superior district (all in Minnesota) in 1938 totaled 5,112,485 gross tons and the beneficiated ore recovered 2,999,464 tons—a ratio of 1.704 to 1. In 1937 the crude ore treated totaled 15,746,547 tons and the beneficiated ore recovered therefrom 9,512,667 tons—a ratio of 1.655 to 1. Most of the concentration in this district is done by washing, but a few plants are equipped with jigs. Processes have been described by Zapffe and Hunner.[2] Most of the concentrated ore shipped from Minnesota is obtained in the treatment of wash ores which yield 65 percent concentrates and 35 percent tailings containing about 22 percent iron. Preliminary tests of a limited number of samples indicate that wash ore tailings are amenable to concentration by flotation and that a merchantable commodity can be produced.[3] The commercial possibilities have been discussed by Counselman.[4] In recent years there has been developed on the Mesabi range a process for roasting ore to the magnetic state and concentrating it on magnetic separators. The process, which is applicable to ores that cannot be concentrated either by washing or jigging, has been described by Davis.[5] A plant utilizing the process produced 6,361 tons of concentrates in 1938, which averaged (natural) 54.80 percent iron, 0.22 percent manganese, 0.046 percent phosphorus, 12.25 percent silica, and 10.04 percent moisture from 12,054 tons of jig tailings—a ratio of 1.895 to 1. The operation of the plant has been described by Craig.[6]

Beneficiated ore comprised a slightly larger part of the total shipments in 1938. Relieved of the pressure of production maintained in 1937, operators apparently did not find it necessary to supply a relatively larger proportion of the total from direct shipping ores. Data for recent years are shown in the following table, and corresponding statistics for 1914 (the first year for which they were gathered) to 1929 are given in Mineral Resources, 1930. Data for 1930 to 1933, inclusive, are given in Minerals Yearbook, 1935.

*Iron ore shipped from mines in the United States, 1925–29 (average) and 1934–38, in gross tons, and percentage of beneficiated ore compared to the total shipped*

States or groups of States, except where there are fewer than three shippers of a certain variety of ore in a State and permission was not given to publish the value. These data are taken directly from statements of producers and probably represent the commercial selling prices only approximately, as not all reports are comparable. Some evidently include mining costs only; others contain, in addition, the cost of selling and insuring the ore; others include an allowance for a sinking fund; and still others comprise only costs charged against blast furnaces. None of the reports, however, is supposed to include freight charges.

[2] 1937: California, Mississippi, Nevada, New Mexico, Utah, Virginia, Washington, and Wyoming; 1938: California, New Mexico, Tennessee, Utah, Virginia, Washington, and Wyoming.

*Consumption.*—The production of 18,582,322 gross tons of pig iron in 1938 required 32,373,834 tons of iron and manganiferous iron ores, 2,271,055 tons of mill cinder and roll scale, and 300,578 tons of purchased scrap, an average of 1.880 tons of metalliferous materials per ton of iron made.

The greater part of the iron ore used in Alabama furnaces in 1938 was hematite, chiefly from mines in Jefferson County, but some came from Etowah and St. Clair Counties. Considerable brown ore, iron sinter, pyrite ash, and imported iron ore and manganese ore and small quantities of domestic manganese-bearing ores were used. The brown ore came chiefly from mines in the Birmingham and Russellville districts, Alabama. In addition to the iron sinter (sintered pyrite ash) from Tennessee, considerable pyrite ash was shipped to Birmingham in 1938 from acid plants in other Southern States. The pyrite from which the ash was made was of both domestic and foreign origin. The domestic manganese-bearing ores came chiefly from Alabama, Arkansas, Georgia, and Tennessee. Imported manganese-bearing ores came from Cuba. In 1938 Alabama furnaces consumed an average of 2.460 tons of ore in making 1 ton of pig iron, the highest average for any State.

Maryland furnaces consumed considerable domestic ore in 1938 in addition to ores from Africa, Australia, Brazil, Chile, and Cuba. These furnaces used an average of 1.554 tons of ore per ton of pig iron; however, they used proportionately more cinder, scale, and scrap than furnaces in any other State.

Digitized by Google

Illinois, Indiana, Kentucky, Michigan, Minnesota, Ohio, and West Virginia blast furnaces operated on Lake Superior iron ore and manganiferous iron ore exclusively. Kentucky furnaces had the lowest consumption of metal-bearing material per ton of iron.

In New York the furnaces in the Buffalo district used ore chiefly from the Lake Superior district, and the furnace at Standish handled magnetite from the Chateaugay mine at Lyon Mountain, N. Y. The furnace at Troy used chiefly magnetite from Mineville, N. Y., plus some manganese-bearing material from Canada in 1938.

Virtually all the ore consumed in western Pennsylvania furnaces came from the Lake Superior district. Those in the eastern part of the State used some Lake ores; magnetite ores from Pennyslvania, New Jersey, and New York; and considerable ore from Australia, Chile, Cuba, India, Sweden, and the U. S. S. R.

The Pueblo (Colo.) blast furnaces employed hematite from the Sunrise mine in Wyoming, rhodochrosite from Butte, Mont., and manganese-bearing ores from Colorado and New Mexico.

The Provo (Utah) furnace consumed chiefly semialtered magnetite from the Iron Mountain mine near Cedar City, Utah, and manganese tailings from Philipsburg, Mont.

The Tennessee furnace used Tennessee brown ore and iron sinter.

*Foreign trade.*—Imports of iron ore in 1938 decreased 13 percent from 1937. Chile continued to be the chief source of imports into this country, furnishing 74 percent of the 1938 total, while Sweden supplied 10 percent and Cuba 7. In addition to the figures in the following table, 61 tons of dross or pyrites ash were imported from Canada.

Exports of iron ore from the United States totaled 591,524 gross tons valued at $1,954,287 ($3.30 a ton) in 1938 compared with 1,264,102 tons valued at $4,039,248 ($3.20 a ton) in 1937. Of the 1938 total, 591,185 tons went to Canada.

*Mining in Cuba.*—Shipments of iron ore from Cuba to the United States decreased 69 percent in 1938 from 1937. The 1938 total of 152,099 gross tons included 95,721 tons of hematite carrying (dried) 54.86 percent iron and 45,491 tons of siliceous ore carrying (dried) 31.65 percent iron from the Daiquiri-Juragua mines on the southern coast and 10,887 tons of nodulized brown ore carrying (dried) 55.41 percent iron from the Mayari mines near the northern coast. The Mayari mine was idle during the last 9 months of the year.

[1] Of this quantity, 5,932 tons were sent to Pictou, Nova Scotia, and 64,228 tons to other ports outside of the United States.

## REVIEW OF LAKE SUPERIOR DISTRICT

*Production.*—Activities in the Lake Superior district (the principal producing district) were at a much lower rate in 1938. The abrupt decline in steel production during the last quarter of 1937, and the low operating rate that was maintained subsequently, reduced consumption; in consequence, abnormally high stocks accumulated at lower Lake ports and furnaces at the beginning of the 1938 shipping season. The larger stocks, together with the lower level of steel operations which continued throughout 1938, reduced the demand for Lake ores. Production decreased 65 percent and was the lowest since 1934. The district furnished 75 percent of the United States total in 1938 compared with 86 percent in 1937. The lower proportionate share is a result of higher rates of steel activity in districts depending on other ores, notably the Birmingham district.

Several ranges contribute to the district total. The Mesabi was the largest producer, contributing 62 percent of the district total and 47 percent of the United States total in 1938. The output, by ranges, is shown in the following table. After 1905, the figures do not include manganiferous iron ore containing 5 percent or more manganese.

*Iron ore mined in the Lake Superior district, 1854–1938, by ranges, in gross tons*

Digitized by Google

Much of the ore produced on the iron ranges of the Lake Superior district comes from open-pit mines. In 1938 this amounted to 55 percent. A large part of the open-pit production comes from operations on the Mesabi range, which in 1938 supplied 93 percent of the open-pit ore mined in the district. There is no open-pit mining in Wisconsin and relatively little in Michigan. In addition to the output on the Mesabi range there is some open-pit production in Minnesota on the Cuyuna range.

Recent years have witnessed significant changes in open-pit mining practice in the iron country. In the past the trend toward larger units, the replacement of steam by electric power on excavating shovels with caterpillar treads, and (to a more limited extent) the use of electric transportation equipment were the usual development. During the last few years, however, the increased use of trucks and the introduction of large belt conveyors to replace locomotive haulage out of pits are noteworthy. Small, standard-type dump trucks have been used in clean-up or scram operations within the pits, but during the 1936 season the first effort was made to use heavy truck haulage in transporting overburden and iron ore. The new units in use today range from 15 to 20 tons in capacity and are equipped with powerful gasoline or Diesel engines and supplemented by trailers or wagons on rubber or crawler treads.[7] Trucks handling 35 tons of ore have been tested at some properties. The moving of ore from pits, including the use of trucks and trailers, has been discussed by Moore,[8] while the application of trucks has been described by Whitney and Holt.[9] Conveyor belts originally were used in this district in concentrators and first applied to iron mining at the La Rue mine,[10] an underground operation. The use of tractors and wagons with caterpillar treads, and of conveyors for transporting ore from shovels to the surface is a feature of operations at the St. Paul pit near Keewatin. Crawling tractor trucks equipped with trailers are used to bring the ore to the conveyor-belt system, which is 900 feet long. Trucks and conveyor belts also are used at the Leetonia mine, whereas the Louise pit on the Cuyuna range uses Diesel-powered trucks only. In August 1937 a conveyor-belt system 4,481 feet long with a lift of 387 feet was put into operation at the Spruce open-pit mine, Eveleth, Minn., where the depth had reached the economical limit for steam-locomotive haulage. The Spruce open pit operated entirely under this new mining method throughout the 1938 shipping season. The new conveyor system, which will convey 750 tons per hour to a shipping pocket on the surface, extends under the ore body, and the ore is fed to the belt through raises equipped with jaw crushers and feeders. The ore is transported to the raises by tower excavators or by 20-ton trucks. The mining method has been described by Schwedes.[11] At the Judd pit on the western Mesabi range a truck-conveyor transport system with an 800-foot conveyor belt was erected in 1937. It

Digitized by Google

is reported that similar operations are planned at other mines, as the combination of trucks, smaller shovels, and scrapers permits greater flexibility, and such equipment may be used alone as well as with the heavier railroad-type transportation equipment now predominating. Such operations permit removal of ore tied up in track benches and allow extraction closer to property lines. Smaller ore bodies and clean-up jobs around larger pits may also be handled. In addition, conveyor installations may be adapted to underground practice using top-slicing or sublevel-caving methods.

New methods in iron-mining technology are not confined to open-pit operations. A new circular ventilating shaft 5½ feet in diameter and 1,208 feet deep, using the shot-drill method developed at the Idaho-Maryland mine in California, was sunk during 1938 at the Zenith mine on the Vermilion range. This method of sinking mine openings is reported to be safer, cheaper, and faster than earlier methods.[12] The sublevel-caving method of mining used in the larger ore bodies at the Montreal mine in Wisconsin has been described by Bowen.[13]

A new handbook relating to the Lake Superior iron-mining industry has been published by the Lake Superior Iron Ore Association.[14] It contains chapters on history, geology, mineralogy, classification and sampling, grading, preparations for market requirements, shipment, and reduction; a directory of the mines; maps of all ranges; a flow map; and tables and charts showing shipments, distribution and consumption of ore, analyses, reserves, taxes, prices, and other pertinent information.

*Shipments.*—Interlake navigation in 1938 opened on April 13, but only 260,513 gross tons were shipped from Lake ports during the month compared with 3,770,555 tons in April 1937. The season's total was considerably below that in 1937 and with the exception of 1932 was the lowest since 1900. Shipments of ore from the Lake Superior district totaled 19,546,835 gross tons (19,254,171 tons of iron ore and 292,664 tons of manganese-bearing ores containing 5 percent or more manganese) in 1938 compared with 63,194,044 tons (61,926,405 tons of iron ore and 1,267,639 tons of manganese-bearing ores) in 1937. The iron ore statistics given above include 147 tons of paint ore in 1938 and 1,618 tons in 1937.

*Analyses.*—The following table, compiled by the Lake Superior Iron Ore Association, summarizes the average analyses of the total tonnages of all grades of ore shipped and shows the remarkable uniformity maintained during the past 5 years. This uniformity does not mean, of course, that the average grade of available Lake Superior ore is not declining. The grade of shipments has been maintained partly by beneficiation and partly by mixing ores from different deposits. The method of sampling and grading Lake Superior iron ores has been described by Bayer,[15] and the method of classification and sampling has been described by Murray.[16]

*Average analyses of total tonnages of all grades of iron ore from all ranges of Lake Superior district, 1934–38*

| Year | Gross tons | Iron (natural) | Phosphorus | Silica | Manganese | Moisture |
|---|---|---|---|---|---|---|
| | | *Percent* | *Percent* | *Percent* | *Percent* | *Percent* |
| 1934 | 21,841,382 | 51.49 | 0.087 | 8.93 | 0.76 | 10.66 |
| 1935 | 28,214,056 | 51.44 | .093 | 8.93 | .79 | 10.75 |
| 1936 | 44,745,754 | 51.45 | .091 | 8.62 | .81 | 10.92 |
| 1937 | 61,972,823 | 51.53 | .091 | 8.27 | .82 | 11.31 |
| 1938 | 19,353,497 | 51.90 | .089 | 8.25 | .81 | 10.13 |

*Stocks at Lake Erie ports.*—At the close of navigation in 1938, according to the Lake Superior Iron Ore Association, 5,290,294 gross tons were in stock at Lake Erie ports compared with 6,073,262 tons on the corresponding date in 1937. At the opening of navigation in May 1939, 4,484,967 tons were in stock at these ports, a decrease of 910,542 tons from the figure on May 1, 1938. Withdrawals from docks were therefore only 805,327 tons during the winter of 1938–39.

*Prices of Lake Superior ore.*—The prices established May 23, 1938, for the four standard grades of Lake Superior ore were the same as for 1937 but 45 cents per ton more than the price that had been maintained for 1929 to 1936. The unit prices for 1937 and 1938 for base ore of the various grades quoted at Lake Erie ports were as follows: Old-range Bessemer, 10.194 cents; Mesabi Bessemer, 9.903 cents; Old-range Nonbessemer, 9.903 cents; and Mesabi Nonbessemer, 9.612 cents. The prices per gross ton that correspond to these unit prices are, respectively, $5.25, $5.10, $5.10, and $4.95. The base of the four standard grades for 1925–38 is an iron content of 51.5 percent natural. For the bessemer grades the phosphorus content is 0.045 percent (dry), while for the nonbessemer grades the phosphorus content ranges from 0.045 to 0.18 percent. Ores containing over 0.18 percent phosphorus are classed as high-phosphorus ores, while those containing 18 percent or more silica are classed as siliceous ores.

*Reserves.*—Estimates of ore reserves for Minnesota, furnished by the Minnesota Tax Commission, and for Michigan, furnished by the Michigan Board of Tax Commissioners, shown in the following tables cover developed and prospective ore in the ground and ore in stock piles. These estimates reveal a decrease from the previous year of 23,201,051 gross tons in Minnesota but an increase of 1,147,551 tons in Michigan. Reserves in Wisconsin have been estimated recently at 5,500,000 tons.

*Iron-ore reserves in Minnesota, May 1, 1934–38, in gross tons*

## MINING BY STATES

*Alabama.*—Although output of iron ore in Alabama was curtailed in 1938 the reduction was not as severe as in other large producing districts, and a number of mines that had been shut down resumed operations later in the year. Production in Alabama in 1938 decreased 32 percent from 1937. About 92 percent of the 1938 production came from underground mines and the remainder from open-cuts. Hematite represented 92 percent of the 1938 total, and much of this red ore contained enough or nearly enough lime to be self-fluxing. The hematite is derived chiefly from underground mines on Red Mountain near Birmingham in Jefferson County, where in 1938 Raimund Nos. 1 and 2, Red Mountain group (comprising the Muscoda, Wenonah, and Ishkooda groups), Sloss Nos. 1 and 2, Spaulding, and Woodward No. 3 mines contributed to production. The iron content of the hematite produced in 1938 averaged (natural) 35.49 percent, the manganese content 0.16 percent, the phosphorus content 0.31 percent, and the lime content 15.42 percent. The Red Mountain group with 2,282,382 tons was the largest producer in the United States in 1938.

Limonite (brown ore) is mined from a number of widely scattered deposits in Alabama, but production is not nearly so large as that of red ore. In 1938 brown ore comprised 8 percent of the Alabama total. Brown ores, however, are of higher grade and usually have been subjected to beneficiation, although some operations are rather crude. The brown ore mined in 1938 averaged (natural) 47 percent iron and 0.72 percent manganese. Brown ore is mined from open-cuts and was produced chiefly from the Russellville mines in Franklin County, the Champion mine in Blount County, and the Martaban, Reno, and Woodstock mines in Tuscaloosa County.

*California.*—Production in California in 1938 was small and came from three mines, one producing magnetite (in Santa Cruz County) and two producing hematite (one in San Bernardino County and one in Inyo County). The magnetite averaged 60 percent iron; the hematite, which averaged 55 percent iron, was absorbed chiefly by the cement industries.

*Georgia.*—Four mines in Bartow and Polk Counties furnished the output from Georgia in 1938. The Cartersville Barium Corporation in Bartow County was the largest producer. The entire output from Georgia was brown ore and contained (natural) 37 to 49 percent iron and 0.17 to 4 percent manganese.

*Michigan.*—Output from Michigan comes from three ranges—the Marquette, the Menominee, and the Gogebic. All ranges decreased their production in 1938, the Marquette showing the largest tonnage

Digitized by Google

decline. Production in Michigan decreased 50 percent in 1938 from 1937 and totaled 6,004,311 gross tons. Eighty-nine percent of the 1938 total came from underground mines; the Maas mine, an underground producer on the Marquette range, was the largest producer. The iron content (natural) of the ore mined in 1938 averaged 52.23 percent compared with 51.50 percent in 1937.

Iron-ore reserves in Michigan at the end of 1938 totaled 149,754,897 gross tons, an increase of 1,147,551 tons during the year.

A report of the iron ore mines of Michigan for 1938, published by the Geological Survey Division of the Michigan Department of Conservation,[17] shows that the average number of men employed was 5,633 (6,230 in 1937), the average number of days worked 157 (238 in 1937), the average daily wage $7.59 ($7.05 in 1937), the average yearly earning $1,192.29 ($1,678.19 in 1937), and the average tons of ore mined per man per day 5.32 (7.12 in 1937).

The data in the following table on average per-ton costs of mining ore at underground mines and at siliceous open pits have been abstracted from statistics published in much greater detail by the Geological Survey Division of Michigan.

*Average per-ton costs of mining iron ore at underground mines and at siliceous open pits in Michigan in 1938*

| Item | Underground | | | | Siliceous open pits |
|---|---|---|---|---|---|
| | Gogebic | Marquette | Dickinson and Iron | Total | |
| Cost of mining | $2.0036 | $2.0306 | $1.9554 | $2.0037 | $0.6689 |
| Deferred mining cost | .2622 | .0732 | .1275 | .1480 | .0596 |
| Taxes | .4889 | .4223 | .2745 | .4087 | .0806 |
| General overhead | .2670 | .2606 | .2409 | .2580 | .1305 |
| Transportation | 1.8194 | 1.5140 | 1.6326 | 1.6621 | 1.5176 |
| Marketing | .0572 | .1032 | .0795 | .0807 | .0780 |
| Royalty | .4163 | .3138 | .2767 | .3390 | .0879 |
| Interest on borrowed money | .0009 | .0054 | .0014 | .0079 | .0001 |
| Total ore cost | 5.3155 | 4.7231 | 4.5885 | 4.9081 | 2.6232 |
| Lake Erie value per ton | 5.3916 | 5.2386 | 5.0166 | 5.2307 | 2.4412 |
| Gross ore profit [1] | .0761 | .5155 | .4281 | .3226 | —.1820 |

[1] This figure does not represent true profit, as much ore is sold below the Lake Erie price.

*Minnesota.*—More than 1 billion gross tons (1,134,886,487) of iron ore have been produced in Minnesota. In 1938 output decreased 70 percent from the record total in 1937. Three ranges contribute to Minnesota's production—the Cuyuna, the Mesabi, and the Vermilion. The Mesabi range supplies a large part of the Minnesota total and in 1938 produced 13,256,605 tons. Output from open-pit mines in 1938 supplied 76 percent of the Minnesota total compared with 88 percent in 1937 and 86 percent in 1936. Of the four domestic mines producing more than 1 million tons each in 1938 two were in Minnesota, and both were open pits. Of the 55 mines in Minnesota active in 1938 (84 in 1937), 29 (51 in 1937) yielded more than

[17] Pardee, F. G., and Eddy, G. E., General Statistics Covering Costs and Production of Michigan Iron Mines: Michigan Dept. of Conservation, Geol. Survey Div., Lansing, 1939.

Digitized by Google

100,000 tons each. The iron content (natural) of the ore mined in 1938 averaged 52.31 percent compared with 51.83 percent in 1937.

According to the annual report of the mine inspector of St. Louis County, an average of 3,773 men was employed in iron mines in St. Louis County during 1938 (6,356 in 1937), and the average daily wage was $6.60 ($6.56 in 1937) for 8 hours. In 1938, 3,762,318 cubic yards of overburden were removed compared with 4,529,716 yards in 1937.

In Crow Wing County (Cuyuna range), 384 men were employed in 1938 compared with 894 men in 1937, according to the mine inspector's report. Two hundred and four thousand seven hundred and forty-two cubic yards of overburden were removed in 1938 compared with 1,670,862 yards in 1937.

According to the annual report of the mine inspector of Itasca County, an average of 2,132 men was employed in iron mines in 1938 (4,353 in 1937), and the average daily wage was $5.82 ($6.10 in 1937) for 8 hours. In 1938, 3,807,920 cubic yards of overburden were removed compared with 6,299,581 yards in 1937.

The data in the following table on costs of developing and mining iron ore have been abstracted from statistics published in greater detail by the Minnesota Tax Commission.

*Average per-ton costs of developing and mining iron ore at open-pit and underground operations in Minnesota, 1933–37*

| Year | Developing | Mining | | | Royalty | Total |
|---|---|---|---|---|---|---|
| | | Labor | Supplies | Other items | | |
| Open-pit operations: | | | | | | |
| 1933 | $0.259 | $0.098 | $0.116 | $0.226 | $0.419 | $1.118 |
| 1934 | .248 | .135 | .127 | .205 | .405 | 1.120 |
| 1935 | .253 | .137 | .122 | .172 | .457 | 1.141 |
| 1936 | .230 | .149 | .134 | .197 | .396 | 1.106 |
| 1937 | .242 | .169 | .142 | .151 | .375 | 1.079 |

| 1935 | .065 | .764 | .428 | .249 | .389 | 1.895 |
| 1936 | .048 | .774 | .456 | .275 | .446 | 1.999 |
| 1937 | .055 | .973 | .517 | .283 | .410 | 2.238 |

Iron ore reserves in Minnesota on May 1, 1938, totaled 1,225,773,389 gross tons, a decrease of 23,201,051 tons from the previous year.

*Missouri.*—An undetermined number of small operations in Butler, Carter, Crawford, Dent, Franklin, Howell, Oregon, Phelps, Pulaski, St. Francois, Shannon, and Wayne Counties supplied the iron ore output of Missouri in 1938. The ore, which averaged 51.33 percent iron, comprised both hematite and brown ore, was mined from open-pit and underground operations and was shipped to cement, paint, and steel plants.

*New Jersey.*—Output of iron ore in New Jersey decreased in 1938 from 1937 and totaled 185,639 tons. The ore, all magnetite and all produced from underground operations, came from three mines in Morris County in the northern part of the State. New Jersey ores are crushed and concentrated before shipment. The bulk of the

Digitized by Google

concentration is done magnetically, although some nonmagnetic martite is recovered by gravity methods, and some hand-sorting is practiced, principally to recover high-grade lump used in open-hearth steel furnaces. The concentrates produced in 1938 averaged (natural) 63.24 percent iron. The largest output came from the Mt. Hope mine of the Warren Foundry & Pipe Corporation. The ore hoisted from this mine is hand-sorted and milled; the concentrates from the mill in 1938 averaged (natural) 63.16 percent iron. Other producers were the Scrub Oaks, which was idle most of the year, and Richard mines.

*New Mexico.*—One operation in New Mexico produced 1,826 gross tons of magnetite, carrying (natural) 61.11 percent iron in 1938. The ore was shipped to nonferrous smelters for fluxing purposes.

*New York.*—The production of iron ore in New York in 1938 was chiefly magnetite from underground operations at the Harmony and Old Bed shafts in Essex County and the Chateaugay mine in Clinton County. Some hematite was mined for paint in Oneida and Wayne Counties. Shipments from New York in 1938 included sinter averaging 67 percent iron, lump averaging 61 percent iron, and concentrates averaging 68 percent iron.

The largest producer was the Republic Steel Corporation, which operates properties at Mineville near Port Henry.

The other large producer in New York (the Chateaugay Ore & Iron Co. at Lyon Mountain) produces both for its own consumption and for sale.

*Pennsylvania.*—Pennsylvania is the most important source of magnetite in the United States. The output comes from the Cornwall mine in Lebanon County, where the ore is extracted by both open-pit and underground methods. In addition, some carbonate ore for use in paint was mined in Carbon County in 1938. A description of the operations at the Cornwall deposit has been given by Yaklish.[18]

*Tennessee.*—The output and shipments of iron ore in 1938 came from two mines (one in Hickman County and one in Lewis County), contained 47.15 percent iron, and were all brown ore.

In addition, considerable sintered pyrite ash was made at the plants of the Tennessee Copper Co. in Ducktown Basin. This sinter, which contained 66.6 percent iron and 0.005 percent phosphorus in 1938, moved largely to the blast furnaces in the Birmingham district, where it was added to the blast-furnace burden. Such sinter is not included in iron ore production or shipment figures for the United States. The situation regarding iron ores and the iron industries of the Tennessee Valley region has been outlined by Eckel.[19]

*Texas.*—There has been no commercial production of iron ore in Texas since 1921, but extensive deposits are known to exist. The following is a summary of a bulletin published by the Federal Geological Survey regarding deposits in eastern Texas.[20]

The brown iron ore or limonite deposits described in this report occupy parts of the Coastal Plain province in eastern Texas. Ferruginous material is widely distributed, but the most promising deposits occupy small parts of Cass, Cherokee,

Marion, and Morris Counties. Since 1855 nearly 700,000 tons of ore has been produced. In the northern part of the field the ore occurs as nodules or thin lenses associated with more or less thoroughly weathered Weches greensand, of Eocene age. Farther south the ore forms one solid and nearly continuous bed at the top of the Weches. Chemical and other considerations indicate that the brown ore is derived from the greensand by weathering processes and that the two chief types of ore are due to differences in character of the parent greensand and to different ground-water conditions. Between 150,000,000 and 200,000,000 tons of comparatively high-grade ore is apparently available. These figures do not take into account an enormous tonnage of low-grade material that might possibly be used many years hence. The future of the district appears to depend largely on the solution of transportation problems. The report contains many analyses of the ores and detailed descriptions of all the important deposits. Geologic maps of parts of Cass, Marion, Morris, Cherokee, and Henderson Counties show the distribution and classification of the ores.

*Utah.*—Two operators in Iron County supplied the Utah total in 1938. By far the larger output came from the Iron Mountain mine, while a relatively small quantity came from the Great Western mine. The ore, principally semialtered magnetite, contained (natural) 54.11 percent iron and moved largely to the blast furnace at Provo, Utah, although small quantities went to steel plants and cement plants.

*Virginia.*—The output of iron ore in Virginia is small. All of the 1938 production was brown ore from Botetourt County and averaged (natural) about 53 percent iron. The ore was used chiefly in the manufacture of hydrogen gas.

*Washington.*—One open-pit and one underground mine produced the total output of Washington in 1938. The two mines—the Napoleon in Stevens County and the Keystone in Pend Oreille County—yielded hematite, averaging (natural) 39.41 percent iron, which was used for cement manufacture.

*Wisconsin.*—The Montreal mine, an underground operation in Iron County, was the larger producer of iron ore in Wisconsin, contributing 796,780 gross tons of the 854,795 produced in 1938. The ore—hematite—averaged (natural) 53.11 percent iron, 0.98 percent manganese, and 0.058 percent phosphorus. The Cary mine, also an underground operation in Iron County, was the other producer in 1938, furnishing 58,015 tons of hematite containing (natural) 55.39 percent iron, 0.39 percent manganese, and 0.043 percent phosphorus. Shipments from Wisconsin mines totaled 625,378 tons in 1938.

*Wyoming.*—The output of iron ore from Wyoming in 1938 came from the Sunrise mine and comprised 275,995 gross tons of hematite containing (natural) about 53 percent iron and 0.064 percent manganese. Much of the ore is a red, earthy hematite similar to Mesabi ore. Production came from open-pit and underground operations. Block-caving methods in use at this mine have been described by Rupp.[21]

## MEN EMPLOYED AND OUTPUT PER MAN AT MINES

Although complete information on employment at iron ore mines in 1938 is not yet available, nearly complete figures indicate that about 19,700 men working 30,388,000 man-hours were required to produce 28,447,282 tons of merchantable ore, an average of 0.936 ton per man-hour. Thus, the total man-hours worked in 1938 declined 41 percent from 1937, whereas the output of merchantable ore decreased 61 percent; in consequence, output per man-hour was 33 percent less. The decline in the output per man-hour in 1938 compared with 1937 was due mainly to a shift in the production of ore from open-pit to underground mines. Specifically, about half the output came from open-pit mines in 1938 compared with about two-thirds in 1937.

During 1937, the last year for which complete statistics are available, near-record output of iron ore resulted in an increase in labor at the

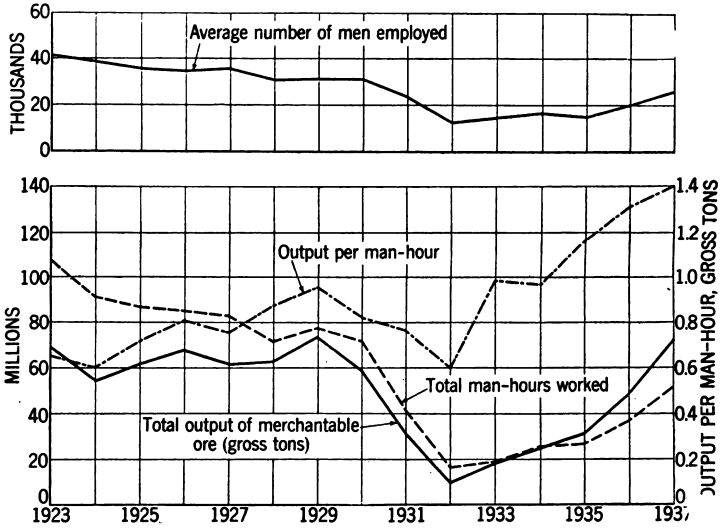

FIGURE 3.—Trends in number of men employed at iron ore mines, output of merchantable ore, man-hours worked, and output per man-hour in the United States, 1923–37.

mines. The average number of men increased, as did the average number of days worked, but the increase in man-hours did not parallel the increase in output, and as a result the output per man-hour again increased. In 1937, 25,945 men working 51,416,193 man-hours produced 72,093,548 tons of merchantable ore, an average output of 1.402 tons per man-hour, while in 1936, 20,306 men working 37,246,583 man-hours produced 48,788,745 tons of merchantable ore, or 1.310 tons per man-hour. Thus, while the average number of men employed increased 28 percent from 1936 to 1937 and the number of man-hours increased 38 percent, the output of merchantable ore increased 48 percent, resulting in an increase of 7 percent in the output per man-hour. The output per man-hour in 1937 exceeded that for any year since records have been compiled and undoubtedly was greater than in any other year. The relatively smaller labor require-

Digitized by Google

ments in 1937 than in 1936 resulted from several factors—proportionately larger outputs from open-pit mines and of direct shipping ore, nearer capacity production of operating units, and an increase in the number of days worked. Conversely, the stripping per ton of open-pit ore increased, but apparently this factor was overshadowed by the items listed above.

The number of man-hours of labor increased in all districts in 1937 over 1936, but the increase was relatively less in the Lake Superior district than in the other chief producing districts. In the Lake Superior district the output of merchantable ore per man-hour continued to increase, reaching 1.779 tons in 1937—11 percent more than in 1936. Despite the greater productivity, the large gain in output in 1937 over 1936—19,876,420 tons (48 percent)—required employment of only 26 percent more men; this, plus a small increase in the average number of days worked, caused a rise of 33 percent in the number of man-hours worked. Much of the Lake Superior output comes from Minnesota, where open pits furnished 88 percent of the ore in 1937. Because of this preponderant production from open pits, output per man-hour in Minnesota is greater than in any other State or district and in 1937 amounted to 2.479 tons, an increase of 11 percent over 1936. Although, as was pointed out in Minerals Yearbook, 1934 (p. 322), the improved performance in mining iron ore has been closely related to advances in mechanization, better mining methods, operation of larger units, and more efficient management of mines, the gain in the 5-year period 1933–37 compared with the 10-year period 1923–32 was due chiefly to the expansion of open-pit operations in Minnesota. For example, while about 75 percent of the merchantable ore produced in Minnesota from 1923 to 1932 came from open-pit mines, 86 percent was so produced in 1933–37. The significance of this shift can be appreciated when it is recalled that Minnesota contributed more than 61 percent of the total merchantable ore produced in 1923–37 and that during that period the output of men in open-pit operations averaged 2.029 tons per man-hour compared with only 0.696 ton per man-hour for workers at underground mines.

The greater output per man-hour in recent years also was due in part to the stripping of proportionately less overburden in Minnesota in 1933–37 in preparation for future mining than in 1923–32. In 1933–37 about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined in Itasca and St. Louis Counties, Minn., whereas in 1923–32 about one-half cubic yard of overburden was removed for each ton of merchantable ore mined. Any material shift in the labor force used for direct mining of the ore at the expense of that used in stripping will result in a much lower man-hour cost of mining for any year. This is illustrated strikingly in figure 4, which shows that in 1926, 1933, 1935, 1936, and 1937, when only about one-fourth cubic yard of overburden was removed for each ton of merchantable ore mined at both open-pit and underground mines, the output per worker increased substantially, whereas during the other years, when one-third to four-fifths cubic yard of overburden was removed for each ton of ore mined, the output per worker decreased.

Another factor that affects the output per man-hour is the tendency to mine leaner ore. Proportionately more lean ore requiring beneficia-

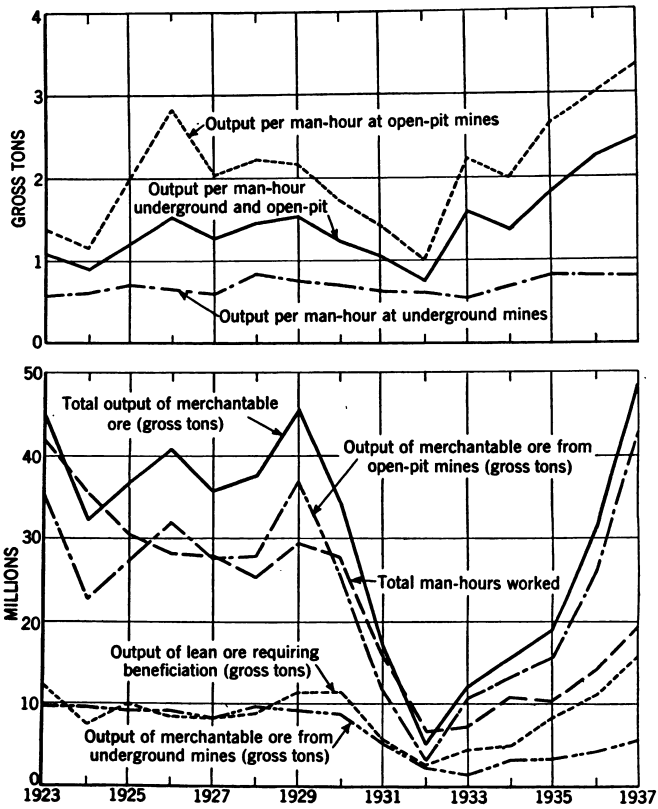

FIGURE 4.—Trends in output of merchantable iron ore per man-hour at open-pit mines in Minnesota compared with production of merchantable and lean ore and total man-hours worked, 1923–37.

tion has been mined in Minnesota in recent years than during the period 1923–32. In 1933–37, for instance, beneficiated ore represented 21 percent of the total merchantable ore compared with an average of only 16 percent in 1923–32.

The bulk of the ore in the Southeastern district, the second largest producing region, is obtained from underground operations. Output of merchantable ore per man-hour in this area increased to 0.624 ton in 1937 from 0.582 ton in 1936. The largest and most consistent producing mines in the Southeastern district are in Jefferson County, Ala., where 4,030 men working 8,418,520 man-hours in 1937 produced 5,688,768 tons of merchantable ore, equivalent to an average output of 0.676 ton per man-hour. Virtually all ore produced in Jefferson County comes from underground operations. In comparing the man-hour cost of mining ore in Jefferson County, Ala., with that at underground mines in the Lake Superior district one should remember that whereas the ore in the Lake Superior district is considerably richer in iron, the ore from the Jefferson County mines contains enough or almost enough lime to make it self-fluxing. Thus, it should be recognized that the lower iron content is partly offset by the self-fluxing

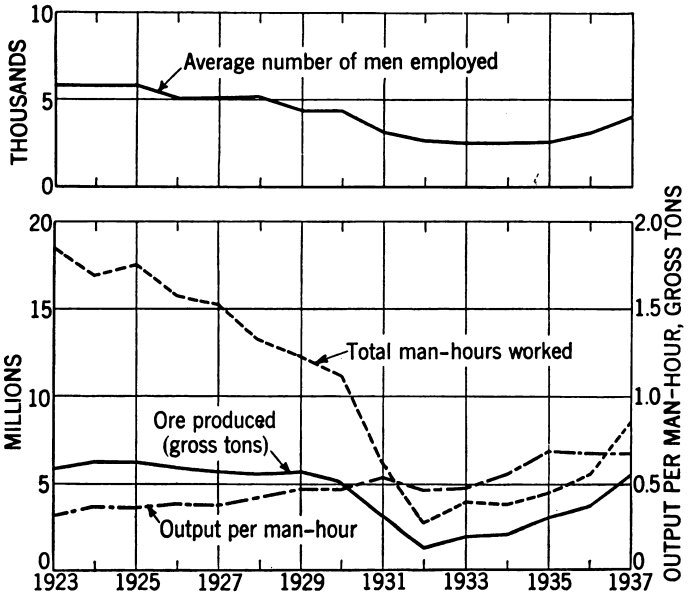

FIGURE 5.—Trends in production, man-hours worked, output per man-hour, and number of men employed at iron-ore mines in Jefferson County, Ala., 1923-37.

nature of the ore, although it is impossible to show this important characteristic in the productivity figures.

In the Northeastern district the average output of merchantable ore per man-hour decreased to 0.523 ton in 1937 from 0.603 ton in 1936. The drop in productivity was due in part to relatively larger increases in output from mines in New Jersey and New York, where virtually the entire output came from underground operations, resulting in a relatively higher expenditure of labor than in Pennsylvania, where output is predominantly from the open pit at Cornwall and productivity is high.

The following table shows employment at iron mines and beneficiating plants, quantity and tenor of ore produced, and average output per man by districts and States in 1937. Corresponding statistics and supplementary data are given in Minerals Yearbook, 1934 to 1938, inclusive.

## WORLD PRODUCTION

The following table shows the production of iron ore by countries from 1934 to 1938, insofar as statistics are available. Complete returns for 1938 are not yet available, but the data for 1937 are nearly complete. Output in 1937 was larger than in any other year, amounting to 213,700,000 metric tons, of which the United States supplied 34 percent. World production was lower in 1938, the curtailment amounting to about 25 percent.

*Iron ore produced, 1934–38, by countries, in metric tons*

[Compiled by M. T. Latus]

| Country [1] | 1934 | 1935 | 1936 | 1937 | 1938 |

## PIG IRON

*Production and shipments.*—Domestic production of pig iron, exclusive of ferro-alloys, decreased 49 percent in 1938 from 1937 and was the lowest since 1934. The output in 1938 comprised 18,543,391 gross tons using coke and 38,931 tons using charcoal as fuel. Pennsylvania was the largest producer of pig iron in 1938, with 26 percent of the total; and Ohio ranked second, with 23 percent. Of the pig iron manufactured in 1938 it is calculated that 890,444 tons valued at $15,488,069 were made from 1,507,584 tons of foreign ores, including ore from Africa, Asia, Australia, Brazil, Chile, Cuba, Sweden, and the U. S. S. R., indicating an average yield of 59.06 percent from imported ore. Domestic ore (30,866,250 tons) and cinder, scale, and purchased scrap (2,571,633 tons) totaling 33,437,883 tons were reported used in the manufacture of 17,691,878 tons of pig iron, indicating an average pig-iron yield of 52.91 percent from domestic materials. In addition, 763,832 tons of home scrap and 951,000 tons of flue dust were consumed in making pig iron in 1938.

Shipments of pig iron, exclusive of ferro-alloys, in 1938, were 48 percent below 1937 and the lowest since 1934. The total value of shipments decreased 51 percent. The values given represent the approximate amounts received for the iron f.o.b. furnaces and do not include freight costs, selling commissions, and other items that are figured in some of the market prices of pig iron published by trade journals.

*Pig iron produced and shipped in the United States, 1937–38, by States*

*Value at blast furnaces.*—The average value of all kinds of pig iron given in the accompanying table is based on reports of manufacturers to the Bureau of Mines. The figures represent the approximate values f. o. b. blast furnaces and do not include the values of ferro-alloys. The general average value for all grades of pig iron at the furnaces was $19.61 a gross ton in 1938—$1.15 less than in 1937.

*Average value per gross ton of pig iron at blast furnaces in the United States, 1934–38*

*Consumption.*—The consumption of pig iron dropped 46 percent in 1938 from 1937. Pig iron, a product of the blast furnace, is a semiraw material and, except for the small quantity used in direct castings (about 1 percent of the total consumption), moves to other type furnaces for further refining or mixing with other required ingredients. In general, it goes to steel-making or iron-making furnaces. By far the larger part is taken to steel-making furnaces (open hearth, bessemer, and electric) for refining and processing into steel. In 1938, as in recent years, about 85 percent of the pig iron was consumed in steel making. The open hearths, however, are taking a proportionately larger share, increasing progressively from 70.7 percent of the total in 1935 to 74.2 percent in 1938, while the bessemer furnaces dropped from 14.1 to 10.5 percent. With direct castings taking about 1 percent of the total, the remaining 14 percent is consumed in iron-making furnaces of which the cupola is by far the most important. The consumption of pig iron by types of furnace for the years 1935 to 1938, inclusive, the period for which data are available, is shown in the following table. Typically, the quantities of pig iron used in these furnaces are supplemented by the addition of ferrous scrap. The proportions of scrap to pig iron used in steel furnaces changed only slightly in 1938 compared with 1937, while the proportion of pig iron in cupola furnaces decreased.

[1] Some pig iron used in making direct castings included in cupola. [2] Less than 0.05 percent.

Digitized by Google

The consumption of pig iron in this country is widespread, and plants using pig iron are situated in all 48 States, in the District of Columbia, and Alaska. As expected from the nature of its use the great concentration of consumption is in the iron and steel-making centers of the North Central, Middle Atlantic, and Southeastern States. These areas in 1938 used 98 percent of the pig iron, Pennsylvania (the leading consumer) taking nearly 26 percent of the total and Ohio (a close second) 23 percent. Of the consuming areas in 1938 the Southeastern district, including the Birmingham district of Alabama, recorded the smallest decline from 1937—24 percent compared with 53 percent in the Middle Atlantic district and 45 percent in the North Central. In Alabama consumption dropped 23 percent. The following table shows the distribution of pig iron consumption by States from 1935 to 1938, inclusive.

*World production.*—World production of pig iron (including ferro-alloys) in 1938 decreased 20 percent from 1937 and was 4 percent below the 1925–29 average (86,000,000 metric tons). Of the 1938 total the United States supplied 24 percent compared with 36 percent in 1937. Thus, while American production decreased 48 percent, that for the rest of the world decreased only 4 percent.

*Pig iron (including ferro-alloys) produced, 1934–38, by countries, in metric tons*

## FERRO-ALLOYS

*Production and shipments.*—The production of ferro-alloys was 584,724 gross tons in 1938 compared with 1,008,170 tons in 1937, a decrease of 42 percent. In 1938 ferro-alloys were made at 12 blast-furnace plants, 16 electric-furnace plants, and 3 aluminothermic plants; in addition 3 plants made ferrophosphorus, and 1 plant made ferrosilicon as a byproduct. Of the 1938 total 338,254 tons were made in blast furnaces and 244,161 tons in electric furnaces.

The shipments of all classes of ferro-alloys in 1938 decreased 52 percent in quantity and 51 percent in total value from 1937. Compared with the 5-year average for 1925–29 (715,250 tons), 1938 shipments decreased 35 percent.

*Ferro-alloys shipped from furnaces in the United States, 1937–38, by varieties*

| Variety of alloy | 1937 | | 1938 | |
|---|---|---|---|---|
| | Gross tons | Value | Gross tons | Value |
| Ferromanganese | 359,842 | $30,696,748 | 223,720 | $19,144,884 |
| Spiegeleisen | 134,983 | 3,969,822 | 24,939 | 80,830 |
| Ferrosilicon (7 percent or more silicon) | 362,313 | 17,683,900 | 163,775 | 7,999,661 |
| Ferrophosphorus | 15,546 | 1,059,782 | 6,593 | 469,940 |
| Ferrotungsten | 2,474 | 6,279,913 | 484 | 1,453,227 |
| Other varieties [1] | 95,493 | 26,450,327 | [2] 44,601 | [2] 12,662,971 |
| | 970,651 | 86,140,492 | 464,112 | 41,811,513 |

[1] Ferrochromium, ferrocolumbium, ferromolybdenum and calcium-molybdenum compounds, ferrotitanium, ferrovanadium, ferrozirconium, silicomanganese, silicospiegeleisen, and zirconium ferrosilicon.
[2] Also includes ferroboron.

*Ferromanganese.*—Shipments of ferromanganese in 1938 decreased 38 percent from 1937 and were 26 percent below the 5-year average for 1925–29—303,883 gross tons. The average value per ton, f. o. b. furnaces, reported for ferromanganese was $85.58 in 1938 compared with $85.31 in 1937.

The production of ferromanganese in 1938 decreased 35 percent from 1937 and was made at seven blast-furnace plants and one electric-furnace plant compared with six blast-furnace plants and one electric-furnace plant in 1937. In both years the bulk of the output was made in blast furnaces.

*Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1934–38*

| Year | Ferromanganese produced | | | Materials consumed (gross tons) | | | | Manganese ore used per ton of ferromanganese made (gross tons) |
|---|---|---|---|---|---|---|---|---|
| | Gross tons | Manganese contained | | Manganese ore | | Iron and manganiferous iron ores | Cinder, scale, and purchased scrap | |
| | | Percent | Gross tons | Foreign | Domestic | | | |
| 1934 | 139,171 | 78.67 | 109,491 | 256,980 | 853 | 13,933 | 3,304 | 1.853 |
| 1935 | 214,290 | 79.41 | 170,168 | 401,846 | 4,286 | 9,195 | 8,921 | 1.895 |
| 1936 | 316,000 | 79.09 | 249,933 | 595,114 | 5,987 | 12,467 | 2,821 | 1.902 |
| 1937 | 376,443 | 79.54 | 299,425 | 698,052 | 9,444 | 17,511 | 6,017 | 1.879 |
| 1938 | 242,994 | 78.65 | 191,104 | 416,738 | 22,548 | 9,696 | 8,462 | 1.808 |

Digitized by Google

The tonnage of manganese ore used per ton of ferromanganese produced decreased in 1938. Of the total manganese ore used in making ferromanganese in 1938, 5.1 percent was mined in the United States, and 94.9 percent came from foreign sources, as shown in the following table:

*Quantity and tenor of manganese ore used in manufacture of ferromanganese in the United States, 1937–38*

| Source of ore | 1937 | | 1938 | |
|---|---|---|---|---|
| | Gross tons | Manganese content (percent, natural) | Gross tons | Manganese content (percent, natural) |
| Africa | 150,112 | 48.36 | 152,698 | 48.99 |
| Brazil | 112,238 | 41.43 | 64,060 | 41.44 |
| Chile | 186 | 48.92 | | |
| Cuba | 60,012 | 47.28 | 36,295 | 48.07 |
| India | 62,199 | 50.09 | 55,965 | 49.24 |
| U. S. S. R. | 313,305 | 47.79 | 107,720 | 47.61 |
| United States | 9,444 | 53.17 | 22,548 | 53.20 |
| | 707,496 | 47.13 | 439,286 | 47.72 |

*Spiegeleisen.*—Shipments of spiegeleisen from domestic furnaces in 1938 decreased 82 percent from 1937. The average value per ton at the furnaces was $32.41 in 1938 compared with $29.41 in 1937. The entire production, which also decreased, was made in blast furnaces. Output in 1938 averaged 20.24 percent manganese. Most of the spiegeleisen was made from domestic ores in 1938, only 317 tons of foreign manganese ore being used.

*Ferrosilicon.*—Shipments of ferrosilicon in 1938 decreased 55 percent from 1937.

The production of ferrosilicon in 1938 totaled 249,829 gross tons, including 127,759 tons made by blast furnaces, 121,819 tons by electric furnaces, and 251 tons as a byproduct of the manufacture of artificial abrasives in electric furnaces. The silicon content of the production in 1938 ranged from 7 to 95 percent but averaged 26 percent. Most of the raw material used in making ferrosilicon was of domestic origin.

*Ferrophosphorus.*—Production of ferrophosphorus decreased to 15,842 gross tons containing 24.14 percent phosphorus in 1938 from 21,796 tons containing 21.81 percent phosphorus in 1937, and shipments from furnaces dropped 58 percent. Most of the 1938 output was made in electric furnaces. Ferrophosphorus was made entirely from domestic materials in 1938.

*Ferrotungsten.*—Shipments of ferrotungsten decreased 80 percent in quantity and 77 percent in total value from 1937. The 1938 shipments contained 78.85 percent (854,577 pounds) tungsten and were valued at $1.70 per pound of contained tungsten. Production totaled 442 gross tons containing 78.91 percent tungsten (781,668 pounds). In addition to domestic ores (chiefly from California, Colorado, and Nevada), foreign ores from China, Malay States, and South America were used. All ferrotungsten was made in electric furnaces.

*Foreign trade.*—Imports of all alloys of the rarer metals are not recorded separately but are grouped as shown in the following table. Ferromanganese and spiegeleisen comprised the bulk of the imports in

Digitized by Google

1937 and 1938. Imports of ferromanganese for consumption (chiefly from Norway and Netherlands) were 26,258 gross tons—11 percent less than in 1937. Imports of spiegeleisen for consumption (chiefly from Canada) were 17,248 tons, an increase of 2 percent over 1937. The duty on ferrosilicon containing 8 percent but less than 30 percent silicon was cut ½ cent to 1 cent per pound of silicon content, effective January 1, 1939, in the new trade agreement with Canada. That country supplies the bulk of the imports of this material.

Exports of ferro-alloys, which are relatively unimportant from a tonnage standpoint, decreased in 1938 from 1937. Exports of ferromanganese and spiegeleisen in 1938 were 247 gross tons and of other ferro-alloys 1,197 tons.

*Ferro-alloys and ferro-alloy metals exported from the United States, 1937–38, by varieties*

| Variety of alloy | 1937 | | 1938 | |
|---|---|---|---|---|
| | Gross tons | Value | Gross tons | Value |
| Ferromanganese and spiegeleisen | 1,725 | $72,502 | 247 | $18,799 |
| Other ferro-alloys [1] | 2,780 | 2,201,968 | 1,197 | 1,171,869 |

[1] Includes ferrosilicon, ferrotungsten, ferrovanadium, and other ferro-alloys.

## STEEL

*Production.*—Reversing the trend in 1937, when the rate of operation dropped from 81 percent of capacity in January to 25 percent in December, activities in steel production increased during 1938 but did not entirely recover the ground lost during the last quarter of 1937.

The opening of 1938 found operations at a very low level, and during the first half the operating rate was only 31 percent of capacity compared with 85 percent during the first half of 1937. The best month's operation in 1938 was November, when 62 percent of the capacity was employed; during the last quarter of the year the operating rate was about 56 percent of capacity. The following figures covering the output of steel were compiled by the American Iron and Steel Institute. Production of steel ingots and castings in 1938 totaled 28,349,991 gross tons, the lowest since 1934, 43 percent below the 1925–29 average, and a decrease of 44 percent below 1937.

Of the 1938 total, 91.6 percent was made in the open hearth, 6.6 percent in bessemer converters, 1.8 percent in electric furnaces, and only 6 tons in crucible furnaces. The bulk (25,691,963 tons) of the total open-hearth output in 1938 was made in basic furnaces.

Of the total output of steel ingots and castings 28,210,841 gross tons were ingots in 1938 compared with 50,318,151 tons in 1937.

A large part of the steel production comes from the contiguous States—Pennsylvania and Ohio. In 1938 these two States produced about 50 percent of the total steel, 48 percent of the open-hearth steel, and 77 percent of the bessemer steel.

*Open-hearth steel ingots and castings manufactured in the United States, 1934–38, by States, in gross tons*

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

*Steel electrically manufactured in the United States, 1934–38, in gross tons*

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

| Year | Ingots | Castings | Total | Year | Ingots | Castings | Total |
|---|---|---|---|---|---|---|---|
| 1934 | 349,095 | 12,201 | 361,296 | 1937 | 814,310 | 31,227 | 845,537 |
| 1935 | 521,818 | 19,674 | 541,492 | 1938 | 468,610 | 36,414 | 505,024 |
| 1936 | 704,213 | 68,242 | 772,455 | | | | |

The steel-production figure for 1938 includes 1,476,348 gross tons of alloy-steel ingots and castings, which represent 5 percent of the total. The figure includes steels in which the minimum of the range specified in any of the elements named exceeds the following percentages: Nickel, 0.40 percent; chromium, 0.30 percent; copper, 0.50 percent; manganese, 1.65 percent; silicon, 0.50 percent; molybdenum, 0.10 percent; vanadium, tungsten, cobalt, titanium, and zirconium, any percent. Output of alloy steels in 1938 decreased 51 percent from 1937, whereas that of total steel decreased 44 percent. Of the total alloy-steel output in 1938, 71 percent came from basic open hearths, 6 percent from acid open hearths, 23 percent from electric furnaces, 4 tons from crucible furnaces, and 12 tons from bessemer furnaces.

*Production of alloy-steel ingots and castings, 1935–38, by processes, in gross tons*

[Includes only that portion of the steel for castings produced in foundries operated by companies manufacturing steel ingots]

| Process | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|
| Open hearth, basic | 1,633,541 | 2,239,885 | 2,285,000 | 1,052,706 |
| Open hearth, acid | 73,400 | 115,766 | 146,835 | 91,151 |
| Bessemer | | | | 12 |
| Crucible | 154 | 209 | 241 | 4 |
| Electric | 412,563 | 527,762 | 600,550 | 332,475 |
| | 2,119,658 | 2,883,622 | 3,032,626 | 1,476,348 |

From the foregoing tables it will be seen that the bulk (66 percent in 1938) of the steel made in the electric furnace is alloy steel. Typically, steels with higher alloy content are made in the electric furnace, and steels with lower alloy content are made by the open-hearth process.

*Foreign trade.*—Although exports of iron and steel products (excluding scrap) in 1938 were lower than in 1937 they were higher than in

Digitized by Google

any other year since 1929. The volume of export business was off about one-third from the high figure established in 1937, when abnormal demands in foreign markets caused an abrupt rise in shipments. Because of unsettled conditions and expanded armament activities foreign producers were unable to meet demands in their own countries, and buyers turned to the United States for supplies. Shortage of necessary raw materials, inadequate smelting capacity, and finishing and fabricating facilities insufficient to meet expanded demands in other nations caused abnormal exports in a wide range of semimanufactured and manufactured American products. This situation, however, is being rectified by the construction and equipment of new plants and the search for and development of raw material sources. The success of these programs may make other nations more important factors in export markets with a consequent lower demand in this country. Barter methods now being used may make competition difficult for American producers.

Exports of iron ore, pig iron, and ferro-alloys are covered in other items in this report. All important items in the 1938 movement of iron and steel products registered declines. Exports of iron and steel scrap (including tin-plate scrap), though lower than the unprecedented total of 4,101,549 tons in 1937, were high, amounting to 2,998,607 tons. Of the 1938 scrap exports 60 percent went to Japan (46 percent) and Italy (14 percent).

Although exports of American iron and steel products in 1938 reached most of the world's markets Japan was the outstanding purchaser, taking about one-fourth of the total (exclusive of scrap). Canada, United Kingdom, and the Philippines followed Japan in order as the principal takers of American iron and steel in 1938.

Imports for consumption of iron and steel (exclusive of scrap) in 1938 were the lowest since 1921 and amounted to about half of the 1937 volume. The import trade was much lower than the export trade. Declines were recorded throughout the list, and while ferromanganese and spiegeleisen held up fairly well pig iron dropped sharply. Structural shapes, pipes, and bars were imported in largest quantities among the manufactured and unmanufactured articles in 1938, but all were received in much smaller quantities than in 1937. Imports came principally from European countries, Canada, and British India. Imports of scrap in 1938 amounted to only 24,451 long tons (70 percent below 1937), and 97 percent of the 1938 total came from Canada.

# MANGANESE AND MANGANIFEROUS ORES

By Robert H. Ridgway and H. W. Davis [1]

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| General features | 577 | Consumption of manganiferous raw materials | 586 |
| Salient statistics | 577 | Metallurgical industry | 586 |
| Strategic reserve | 578 | Ferromanganese | 587 |
| Domestic production | 580 | Spiegeleisen | 589 |
| Imports of manganese ore | 584 | Manganiferous pig iron | 590 |
| Stocks | 585 | Battery industry | 590 |
| Prices | 585 | Miscellaneous industries | 590 |
| | | World production | 591 |

Demand for manganese ore was less in 1938 than in 1937 owing to a recession in the rate of world steel production, and imports into all large consuming countries decreased. High stocks on hand in some consuming countries, notably the United States, at the beginning of the year and curtailed activities in consuming outlets, materially reduced the volume of business. In consequence, prices slumped heavily as the year progressed.

Despite the sharp drop in imports in 1938 (47 percent below 1937), stocks of ore in bonded warehouses increased sharply and established a new year-end peak. As most of the domestic requirement is supplied by imports, the apparent consumption of manganese ore reflected the drop in imports for consumption. Although the small domestic production decreased, it was stimulated by Navy purchases of ferromanganese which required that the ferro-alloy be made from domestic ores. Two furnaces, one at Reusens, Va., and the other at Minnequa, Colo., supplied the total (largely from Montana ore). The higher rate of steel activity in the Birmingham district compared with other producing centers benefited producers of manganese ore in the Southeastern States.

*Salient statistics of the manganese industry in the United States, 1925–29 (average) and 1934–38, in long tons*

| | 1925–29 (average) | 1934 | 1935 | 1936 | 1937 | 1938 |

Digitized by Google

The Bureau of Mines continued experimental work on the process for the production of pure electrolytic manganese.[2] A license to use the procedure was issued in 1938,[3] and a small pilot plant was under construction at Knoxville, Tenn.

The trend of imports and domestic production of manganese ore is shown graphically in figure 1.

*Strategic reserve.*—In connection with its purchases of certain strategic commodities, the Navy Department issued specifications and called for bids on manganese ore with alternate bids on low-grade

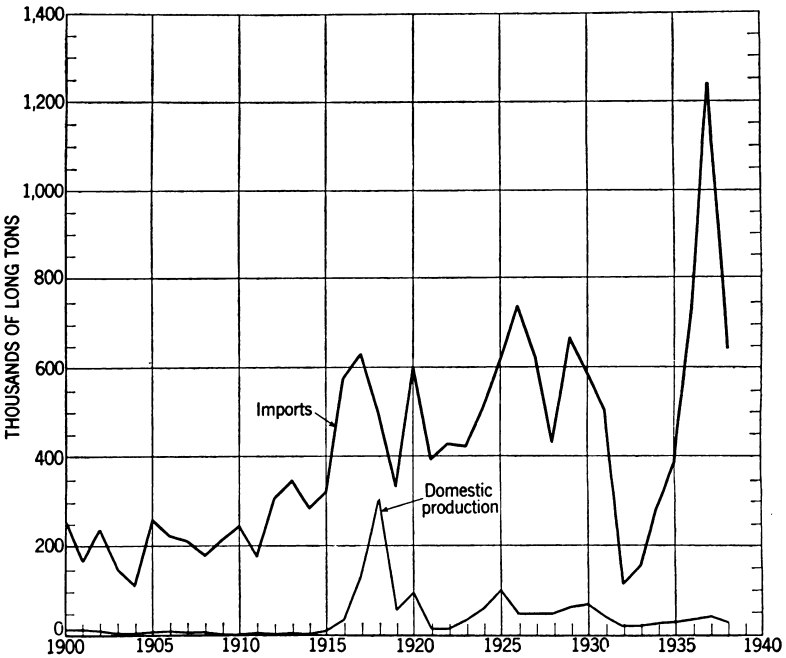

FIGURE 1.—Imports and domestic production of manganese ore, 1900–1938. Statistics on imports shown in the graph represent "general imports" for the period 1900–1933; beginning with 1934 data classified as "general imports" were not available, and the figures plotted for 1934–38 represent imports for consumption adjusted for changes in stocks in bonded warehouses and are closely comparable with the record for earlier years.

ferromanganese, on October 29, 1937. All were rejected, however, because the material specified was not considered satisfactory, and the specifications were reconsidered. Later (March 18, 1938) bids on standard-grade ferromanganese were called for. Early in April two contracts were let—one to E. J. Lavino & Co. for 6,000 long tons at $110.50 per long ton at the Philadelphia Navy Yard and the other to the Colorado Fuel & Iron Corporation for 5,500 long tons at $105 per long ton f. o. b. plant at Minnequa, Colo. The contracts were completed during the year.

These purchases were made from a limited appropriation of the Navy Department for stockpiles of strategic commodities. Legisla-

tion providing the purchase of much larger quantities has been given serious consideration in the past few years, and bills passed both houses of Congress early in 1939. The following tables present data that may be of interest in studying the strategic position of manganese ore.

*Domestic shipments of manganese ore, imports of manganese and ferromanganese, and apparent consumption of manganese metal, 1910–38, in long tons*

| Year | Manganese ore | | | Imports of ferro-manganese (gross weight) | Apparent consumption of manganese metal [1] | |
|---|---|---|---|---|---|---|
| | Domestic shipments | | Imports | | Quantity | Percent from domestic sources |
| | 10 to 35 percent Mn | 35 percent or more Mn | | | | |
| 1910 | (2) | 2,258 | 242,348 | 114,228 | (3) | ---------- |
| 1911 | [4] 2,602 | 2,457 | 176,852 | 80,263 | (3) | ---------- |

## DOMESTIC PRODUCTION

The domestic production (shipments from domestic mines) of manganese ore decreased 37 percent in 1938 from 1937. Of the manganese ore shipped to metallurgical plants in 1938, 5,356 long tons contained (natural) 48 percent or more Mn.

Digitized by Google

*Manganiferous raw materials shipped by producers in the United States, 1934–38, in long tons*

| Year | Metallurgical ore (ferrous metallurgy only) | | | | Battery ore | Miscellaneous manganese ore |
|---|---|---|---|---|---|---|
| | Manganese ore (35 percent or more Mn) | Ferruginous manganese ore (10 to 35 percent Mn) | Manganiferous iron ore (5 to 10 percent Mn) | Manganiferous zinc residuum | | |
| 1934 | 14,978 | 23,231 | 198,591 | 65,236 | 8,889 | 2,647 |
| 1935 | 16,679 | 93,291 | 430,893 | 113,997 | 7,264 | 2,485 |
| 1936 | 18,557 | 98,962 | 841,557 | 124,288 | 7,747 | 5,815 |
| 1937 | 26,419 | 151,955 | 1,189,017 | 115,998 | 6,447 | 7,375 |
| 1938 | 16,989 | 33,620 | 275,240 | 39,079 | 4,959 | 3,373 |

Shipments of the various grades during the last 5 years are given, by States, in the following tables. In addition, battery-grade ores were produced in Montana; manganiferous zinc residuum was produced from New Jersey zinc ores; and miscellaneous manganese ores came from Alabama, Montana, Nevada, Tennessee, Virginia, and West Virginia.

[1] 1 producer in Alabama, 1 in Montana, 2 in Tennessee, 5 in Virginia, and 1 in West Virginia shipped both metallurgical and miscellaneous ore, and 1 in Montana shipped both battery and miscellaneous ore.
[2] Included under "Undistributed."
[3] Mills through which all ore was shipped; producers not counted.

*Alabama.*—All shipments of manganese ore from Alabama in 1938 were made by J. B. Bynum, who operates the Walnut Grove mine at Walnut Grove, Etowah County. The ore shipped to metallurgical plants (111 long tons) averaged (natural) 36.33 percent Mn, while that shipped for miscellaneous uses ran (natural) 74.01 percent $MnO_2$. Shipments of ferruginous manganese ore came from Calhoun and Etowah Counties and averaged (natural) 27.53 percent Mn. No manganiferous iron ore was shipped in 1938.

*Arizona.*—Although no production was recorded in Arizona in 1938, exploration work in the area near Artillery Peak, Mohave County, was continued during the year.

*Arkansas.*—Two shippers, Walter H. Denison and A. B. Reither, supplied the Arkansas total (2,987 long tons) of manganese ore in 1938 from operations in the Batesville-Cushman district in Independence County. The ore averaged (natural) 45.10 percent Mn. In addition, they shipped the entire output of ferruginous manganese ore (3,477 tons). The ferruginous manganese ore averaged (natural) 22.98 percent Mn.

*Colorado.*—No manganese ore was shipped from Colorado in 1938, but 655 long tons of ferruginous manganese ore were shipped from two operations. The bulk of the total came from the King-United mine in San Juan County and contained (natural) 32.5 percent Mn and 20.2

Digitized by Google

percent iron. This property is reported to have closed in October. The remainder came from the Pershing mine in Saguache County and contained (natural) 21.6 percent Mn and 9.2 percent iron.

*Georgia.*—Aside from 1 small carload from McDuffie County near Littleton, which contained (natural) 41.41 percent Mn, all manganese ore from Georgia in 1938 came from four shippers in the Cartersville district in Bartow County, of which the White Manganese Corporation supplied the larger part. The manganese ore from Georgia averaged (natural) 38.91 percent Mn and was shipped to Birmingham, Ala. The Cartersville district likewise supplied the bulk (2,738 long tons) of the Georgia shipments of ferruginous manganese ore which averaged (natural) 16.85 percent Mn. Shipments of 69 tons of ore, which ran (natural) 22.83 percent Mn, were also reported from the Gibson mine in Floyd County. No manganiferous iron ore was shipped from Georgia in 1938, but shipments of untreated iron ore which contained up to 5 percent Mn were continued during 1938. This ore is mined cheaply from small open-cuts and shipped by rail to Birmingham.

*Massachusetts.*—Shipments of ferruginous manganese ore from Massachusetts in 1938, the first in several years, totaled 230 long tons containing (natural) 27 percent Mn and 3 percent iron. The ore came from the Taconic mine in Hampshire County.

*Michigan.*—The Eureka mine in Iron County supplied the manganiferous iron ore shipped from Michigan in 1938. The ore averaged (natural) 5.61 percent Mn and 47.25 percent iron.

*Minnesota.*—All shipments of manganese-bearing ores from Minnesota in 1938 came from the Cuyuna range in Crow Wing County. Of the ferruginous manganese ore shipped in 1938, 16,698 long tons containing (natural) 17.40 percent Mn and 31.67 percent iron came from the Merritt mine, while 726 tons containing (natural) 16.86 percent Mn and 28.39 percent iron came from the Mangan mine. Five properties—the Alstead-Hillcrest, the Hopkins, the Louise, the Sagamore, and the Mahnomen—supplied the shipments of manganiferous iron ore from Minnesota in 1938. The ore averaged (natural) 7.52 percent Mn and 35.84 percent iron.

*Montana.*—Shipments of manganese ore from Montana in 1938 decreased 55 percent from 1937. Of the total, 44 percent was nodulized rhodochrosite from the Emma mine at Butte, which averaged (dried) 59.25 percent Mn, while 42 percent was battery-grade concentrates from the Philipsburg district, which averaged (natural) about 70 percent $MnO_2$. Ores for miscellaneous uses were shipped from both districts. Shipments of ferruginous manganese ore consisted of 133 tons of rhodochrosite from the Emma mine containing (natural) 33.06 percent Mn and 319 tons of tailings containing (dried) 21 percent Mn from the Trout mill. The new mill at the Trout mine was completed and put into operation in 1938.

*Nevada.*—One carload of ore containing (natural) 38.75 percent Mn was shipped from Nevada in 1938.

*New Mexico.*—Shipments of manganese ore from New Mexico in 1938 came from the Luna Manganese Co. in Luna County and contained (natural) 45 percent Mn and 4 percent iron. Shipments of ferruginous manganese ore comprised 5,113 long tons containing (natural) 12.7 percent Mn and 41.2 percent iron from the Boston Hill mine near Silver City in Grant County and 980 tons containing

159434—39——38

Digitized by Google

(natural) 31.4 percent Mn and 8.8 percent iron from the Lake Valley mine in Sierra County.

*Tennessee.*—Operations in four counties—Carter, Johnson, Monroe, and Unicoi—supplied the total output of Tennessee in 1938, which comprised 3,603 long tons averaging (natural) 35.47 percent Mn shipped to metallurgical plants and 527 tons averaging (natural) 42.31 percent Mn shipped to chemical plants. The largest production came from the Embree Iron Co. in Unicoi County near Embreeville, where additional milling capacity was installed during the year. Most of the remainder was supplied by R. U. Butler from the Cedar Hill mine in Carter County. One small carload came from Monroe County near Sweetwater. Shipments of ferruginous manganese ore, which averaged (natural) 15.13 percent Mn, came principally from Johnson County.

*Utah.*—No manganese-bearing ores were shipped from Utah in 1938. The manganese deposits in the Drum Mountains, from which over 15,000 tons have been shipped in the past, have been described by Callaghan.[4]

*Virginia.*—Shipments of manganese ore from Virginia in 1938 decreased slightly compared with 1937 and comprised 928 tons of miscellaneous ore containing (natural) 41.92 percent Mn and 1,314 tons of metallurgical ore containing 40.94 percent Mn. The manganese ore originated in Appomattox, Bland, Campbell, Page, Shenandoah, and Smyth Counties. Shipments of ferruginous manganese ore in 1938 came from Allegheny, Augusta, Bland, Page, and Smyth Counties and averaged (natural) 24.85 percent Mn.

*West Virginia.*—The entire output of West Virginia in 1938 came from the Sweet Springs mine near Sweet Springs, Monroe County. This property, formerly operated by the Monroe Manganese Corporation, was worked in 1938 by the Appalachian Ores Co., which shipped 107 tons of miscellaneous ore averaging (dried) 40 percent Mn and 1 car to a metallurgical consumer containing (natural) 48 percent Mn and 2 percent iron.

*Puerto Rico.*—The entire output of Puerto Rico comes from the mine of the Atlantic Ore Co. about 3 miles from Juana Diaz and is shipped to the United States. Shipments in 1938 were 1,023 long tons containing 50 percent Mn.

## IMPORTS OF MANGANESE ORE

Imports of manganese ore in 1938 decreased 47 percent from the record total of 1937. Receipts declined from all principal sources, except Cuba, the second largest source in 1938. The U. S. S. R. was the largest source and supplied 34 percent of the total. In addition to the 1938 imports shown in the following table, 30,051 tons of ore containing 8,689 tons of manganese (29 percent Mn) valued at $127,430 were imported from the Union of South Africa.

[4] Callaghan, E., Manganese Deposits of the Drum Mountains: Econ. Geol., vol. 33, No. 5, August 1938, p. 508.

| Netherland India | 552 | 1,126 | | 279 | 631 | | 14,082 | 28,607 | |
| Philippine Islands | | | 4,002 | | | 1,600 | | | 44,075 |
| Union of South Africa | 99 | 209 | | 50 | 119 | | 1,347 | 3,125 | |
| U. S. S. R | 289,867 | 383,949 | 166,043 | 141,070 | 186,736 | 80,673 | 2,716,401 | 3,959,955 | 2,661,557 |
| Other countries | 9 | 30 | 14 | 4 | 14 | 7 | 1,810 | 9,584 | 253 |
| | 813,362 | 911,919 | 483,588 | 405,812 | 446,434 | 234,169 | 8,711,799 | 10,451,602 | 6,919,397 |

## STOCKS

Stocks of manganese ore in bonded warehouses rose for the second successive year and reached a peak of 842,048 long tons containing 418,721 tons of Mn at the end of 1938. This abnormally high level of stocks resulted from low activities in the domestic steel industry and from overbuying in 1937.

## PRICES

Prices of manganese ore according to grade and origin, as quoted by the various trade journals, apply to imported ore and (except for battery ore) are on a unit basis. The unit is 1 percent of 1 long ton (22.4 pounds of contained manganese). Prices of battery-grade ore are quoted on a per-ton basis, with a minimum requirement of manganese dioxide.

The prices in the following table are quoted from the Engineering and Mining Journal.

*Domestic prices of metallurgical manganese ore in 1938, in cents per long-ton unit*

[C. i. f. North Atlantic ports, cargo lots, exclusive of duty]

| | Beginning of year | End of year | | Beginning of year | End of year |
|---|---|---|---|---|---|
| Brazilian, 46-48 percent Mn | $0.46 | $0.27 | South African: | | |
| Chilean, 47 percent Mn | .46 | .28 | 50–52 percent Mn | $0.45 | $0.28 |
| Indian, 50 percent Mn | .45 | .30 | 44–48 percent Mn | .40 | .25 |
| Caucasian, 52–55 percent Mn | .45 | .30 | | | |

According to the Engineering and Mining Journal the prices for chemical (battery-grade) ores per long ton in carload lots during 1938 were as follows: Domestic chemical ores containing 70 to 72 percent manganese dioxide dropped about $5 in August and were quoted at $43 to $47 for the rest of the year, while imported ores containing 80 to 85 percent manganese dioxide were quoted at $45 to $60.

## CONSUMPTION OF MANGANIFEROUS RAW MATERIALS

The following table shows the indicated consumption of manganiferous raw materials in the United States in 1938. The table does not consider differences in consumers' stocks at the beginning and end of the year. As such stocks are largely imported ore and the import figure used in the table is that for imports for consumption it is thought that the change in stocks would not be great because the manganese ore may be kept in bond until withdrawn for consumption. The duty is then paid, and the ore is reported as imports for consumption.

*Indicated consumption of manganiferous raw materials in the United States in 1938*

| | Ore containing 35 percent or more Mn | | Ore and residuum containing 10 to 35 percent Mn | | Ore containing 5 to 10 percent Mn | |
|---|---|---|---|---|---|---|
| | Long tons | Mn content (percent) | Long tons | Mn content (percent) | Long tons | Mn content (percent) |
| Domestic shipments | [1] 26,344 | 45 | 72,699 | 16 | 275,240 | 7.4 |
| Imports for consumption | 483,588 | 48 | 30,051 | 29 | [2] 75,285 | 7.7 |
| Total available for consumption | 509,932 | 48 | 102,750 | 20 | 350,525 | 7.5 |

[1] Includes shipments from Puerto Rico. [2] Estimated.

Besides the material shown in the foregoing table, 358,200 long tons of ore containing 2 to 5 percent Mn were used presumably in the manufacture of manganiferous pig iron in 1938 compared with 879,800 tons in 1937. Figures are not available for imports of this class of ore.

### METALLURGICAL INDUSTRY

Although some manganese is used in both the ferrous and nonferrous metallurgical industries the bulk is consumed in the manufacture of iron and steel. Most of the ore entering this industry is used in the manufacture of ferromanganese and spiegeleisen, the forms in which manganese usually is added to steel.

[1] Estimated. [2] Bureau of Mines not at liberty to publish figures.

*Ferromanganese.*—The domestic output of ferromanganese in 1938, which dropped 35 percent from 1937, was produced at the following plants.

Bethlehem Steel Co., Johnstown, Pa.
Carnegie-Illinois Steel Corporation, North Braddock and Etna, Pa.
Colorado Fuel & Iron Corporation, Pueblo, Colo.
Electro Metallurgical Co., Alloy, W. Va.
Jones & Laughlin Steel Corporation, Aliquippa, Pa.
E. J. Lavino & Co., Reusens, Va.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

In addition to the above plants, shipments were made by the Pittsburgh Metallurgical Co., Niagara Falls, N. Y.

The larger part of the ferromanganese produced in this country is made from foreign ores, as shown in the following table.

*Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1934–38*

| Year | Ferromanganese produced | | | Materials consumed (long tons) | | | | Manganese ore used per ton of ferromanganese made (long tons) |
|---|---|---|---|---|---|---|---|---|
| | Long tons | Mn contained | | Manganese ore | | Iron and manganiferous iron ores | Cinder, scale, and purchased scrap | |
| | | Percent | Long tons | Foreign | Domestic | | | |
| 1934 | 139,171 | 78.67 | 109,491 | 256,980 | 853 | 13,933 | 3,304 | 1.853 |
| 1935 | 214,290 | 79.41 | 170,168 | 401,846 | 4,286 | 9,195 | 8,921 | 1.895 |
| 1936 | 316,000 | 79.09 | 249,933 | 595,114 | 5,987 | 12,467 | 2,821 | 1.902 |
| 1937 | 376,443 | 79.54 | 299,425 | 698,052 | 9,444 | 17,511 | 6,017 | 1.879 |
| 1938 | 242,994 | 78.65 | 191,104 | 416,738 | 22,548 | 9,696 | 8,462 | 1.808 |

The sources of the foreign ore used in the domestic production of ferromanganese are shown in the following table.

Digitized by Google

*Foreign manganese ore used in manufacture of ferromanganese in the United States, 1934–38, in long tons*

| Source of ore | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|
| Africa | 46,096 | 69,857 | 199,143 | 150,112 | 152,698 |
| Brazil | 55,778 | 47,663 | 86,032 | 112,238 | 64,060 |
| Chile | 451 | 2,941 | 832 | 186 | |
| Cuba | 16,242 | 56,411 | 32,317 | 60,012 | 36,295 |
| India | 21,460 | 76,983 | 105,289 | 62,199 | 55,965 |
| Philippine Islands | | 520 | | | |
| U. S. S. R. | 116,953 | 147,471 | 171,501 | 313,305 | 107,720 |
| | 256,980 | 401,846 | 595,114 | 698,052 | 416,738 |

Shipments of ferromanganese in 1938 decreased 38 percent from 1937. The record of shipments during the last 5 years has been as follows:

*Ferromanganese shipped from furnaces in the United States, 1934–38*

| Year | Long tons | Value | Year | Long tons | Value |
|---|---|---|---|---|---|
| 1934 | 147,947 | $12,345,697 | 1937 | 359,842 | $30,696,748 |
| 1935 | 194,627 | 16,374,328 | 1938 | 223,720 | 19,144,884 |
| 1936 | 322,353 | 24,088,298 | | | |

Although there is a small export trade in ferromanganese, the quantity manufactured in the United States is supplemented by imports. Ferromanganese imported for consumption in 1938 included 257 long tons containing not over 1 percent carbon, 5,999 tons containing over 1 but less than 4 percent carbon, and 20,002 tons containing not less than 4 percent carbon.

*Ferromanganese imported into and exported from the United States, 1934–38*

| Year | Imports for consumption | | | Exports [1] | |
|---|---|---|---|---|---|
| | Gross weight (long tons) | Mn content (long tons) | Value | Gross weight (long tons) | Value |
| 1934 | 23,349 | 18,702 | $1,441,360 | 222 | $12,580 |
| 1935 | 27,240 | 21,830 | 1,731,411 | 131 | 10,389 |
| 1936 | 37,953 | 30,594 | 2,251,951 | 466 | 26,540 |
| 1937 | 29,559 | 23,888 | 2,163,616 | 1,725 | 72,502 |
| 1938 | 26,258 | 21,118 | 1,770,948 | 247 | 18,799 |

[1] Includes spiegeleisen; not separately classified.

Norway supplied 50 percent of the imports in 1938. Distribution of imports by countries is shown in the following table.

*Ferromanganese imported for consumption in the United States, 1937–38, by countries*

| Country | 1937 | | 1938 | |
|---|---|---|---|---|
| | Mn content (long tons) | Value | Mn content (long tons) | Value |
| Canada | 3,385 | $426,759 | | |

Stocks of ferromanganese in bonded warehouses at the end of 1938 were 8,392 long tons containing 6,974 tons of Mn compared with 11,788 tons containing 9,690 tons of Mn at the end of 1937.

The quoted prices of ferromanganese dropped $10 per long ton for the last half of 1938, as shown in the following table.

*Prices per long ton of ferromanganese in the United States, 1936–38* [1]

[80 percent—delivered at Pittsburgh]

| Month | 1936 | 1937 | 1938 | Month | 1936 | 1937 | 1938 |

[1] Steel, vol. 104, Jan. 2, 1939.

*Spiegeleisen.*—Shipments of spiegeleisen dropped sharply in 1938 and amounted to only 18 percent of the 1937 figure.

*Spiegeleisen produced and shipped in the United States, 1934–38*

| Year | Produced (long tons) | Shipped from furnaces | | Year | Produced (long tons) | Shipped from furnaces | |
|---|---|---|---|---|---|---|---|
| | | Long tons | Value | | | Long tons | Value |
| 1934 | (1) | 45,769 | $1,099,922 | 1937 | (1) | 134,983 | $3,969,822 |
| 1935 | 60,018 | 54,793 | 1,303,574 | 1938 | 11,311 | 24,939 | 80,830 |
| 1936 | 95,137 | 92,336 | 2,249,217 | | | | |

[1] Bureau of Mines not at liberty to publish figures.

Spiegeleisen was manufactured at the following plants in 1938:

E. J. Lavino & Co., Reusens, Va.
New Jersey Zinc Co., Palmerton, Pa.
Tennessee Coal, Iron & Railroad Co., Ensley, Ala.

In addition to these plants the Keokuk Electro-Metals Co., Keokuk, Iowa, made shipments from stock.

Digitized by Google

Most of the spiegeleisen produced in the United States in recent years has been made from domestic raw materials, but 317 long tons of foreign ore containing 48.58 percent Mn were consumed in 1938 in the manufacture of spiegeleisen.

Imports of spiegeleisen for consumption in 1938 increased slightly over 1937. Canada, with 16,783 tons, furnished 97 percent of the supply, while the remaining tonnage came from Norway and the Netherlands.

*Spiegeleisen imported for consumption in the United States, 1934–38*

| Year | Long tons | Value | Year | Long tons | Value |
|---|---|---|---|---|---|
| 1934 | 21,184 | $595,017 | 1937 | 16,841 | $589,766 |
| 1935 | 32,384 | 915,134 | 1938 | 17,248 | 625,480 |
| 1936 | 52,011 | 1,404,983 | | | |

The quoted prices of spiegeleisen at producers' furnaces dropped $5 per long ton July 1 and remained at $28 for the rest of the year.

*Manganiferous pig iron.*—Precise data are not available on the consumption of manganiferous ores in the production of manganiferous pig iron, however 275,240 long tons of domestic ore containing 5 to 10 percent Mn and 358,200 tons containing 2 to 5 percent Mn were shipped in 1938. Foreign manganiferous iron ore (75,285 tons) also was consumed in the manufacture of pig iron. The sources of the foreign ores for the last 3 years are given in the following table. Import figures are not available on ore containing 2 to 5 percent Mn.

*Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1936–38, in long tons*

## BATTERY INDUSTRY

Shipments of manganese ore to battery makers by domestic producers in 1938 totaled 4,959 long tons and shipments from Puerto Rico 1,023 tons, indicating a consumption of 5,982 tons of domestic materials in battery manufacture. Imported manganese ore also was consumed in the battery industry, but no figures are available for such imports.

## MISCELLANEOUS INDUSTRIES

Certain manganese ores with peculiar physical or chemical properties are required for the manufacture of special articles in the chemical, ceramic, and glass industries.

Digitized by Google

## WORLD PRODUCTION

The following table shows, insofar as statistics are available, the world production of manganese ores from 1934 to 1938 and their average manganese content. Most of the figures are from official statistics of the countries concerned; they are supplemented by data from semiofficial and other sources.

*Manganese ore produced in the principal countries, 1934–38, in metric tons*

[Compiled by R. B. Miller]

| Country [1] | Percent Mn | 1934 | 1935 | 1936 | 1937 | 1938 |
|---|---|---|---|---|---|---|
| North America: | | | | | | |

[1] In addition to the countries listed Belgium is reported to produce a small quantity of manganese ore, but statistics of output are not available. Czechoslovakia reports a production of manganese ore, but as it has been ascertained that the product so reported averages less then 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report the output has not been included in the table.
[2] Data not available.
[3] Exports.
[4] Shipments by rail and river.
[5] Estimate included in total.

Digitized by Google

*Brazil.*—Production in Brazil was at a lower rate in 1938; exports were 143,670 metric tons in 1938 compared with 225,682 tons in 1937. The drop was due almost entirely to smaller shipments to the United States. On June 7, 1938, the National Iron Ore and Manganese Producers' and Exporters' Association (Sindicato Nacional de Productores e Exportadores de Minerios de Ferro e Manganês) was founded, whose general object is to coordinate, direct, and supervise exploitation of and trade in these commodities. The association plans to maintain an adequate statistical service and a laboratory for the analysis of ores. Membership in the association comprises most of the larger producers.

*Cuba.*—Output by the Cuban-American Manganese Corporation, the principal producer in Cuba, totaled 123,844 metric tons (dried) in 1938, of which 87,419 tons were nodulized concentrates and 36,425 tons were washed, jigged, or sorted ore. Exports were 118,978 tons, of which 88,731 tons were nodulized concentrates and 30,247 tons were washed, jigged, or sorted ore. The latter material contains 39 to 40 percent Mn, while typical cargo analyses of shipments of nodules are as follows:

*Analyses of shipments of nodulized concentrates, percent*

| | | | | | |
|---|---|---|---|---|---|
| Mn | 51.00 | 50.88 | 51.23 | 50.77 | 50.09 |
| Fe | 2.61 | ------ | 2.78 | 2.65 | 3.15 |
| $SiO_2$ | 10.92 | 10.89 | 10.86 | 9.87 | 10.26 |
| $Al_2O_3$ | 3.00 | ------ | 3.44 | 3.60 | 3.85 |
| CaO | ------ | ------ | ------ | 7.24 | 5.62 |
| P | .088 | .094 | .083 | .091 | .092 |
| Moisture | .08 | 1.06 | .62 | .10 | 1.54 |

It was reported that mining operations were begun in the El Sabalo area in Pinar del Rio in 1938.

*Gold Coast.*—The African Manganese Mines Co., Ltd., which operates at Nsuta near Tarkwa, Wasaw district, Western Province, is the only producer of manganese ore in Gold Coast Colony.

*India, British.*—Water-borne exports from India, normally the second largest producer in the world, decreased to 582,492 metric tons in 1938 from 996,934 in 1937. These figures do not include exports through Mormugao, which were 173,383 tons in 1937.

*Union of South Africa.*—Output in the Union of South Africa in 1938 fell slightly below the peak figure established in 1937. Virtually all the production came from deposits north of Postmasburg in Griqualand West, Cape Province. All Cape ore is exported; exports in 1938 were 319,051 metric tons. Several grades of ore are shipped containing from 28 to over 50 percent Mn, and a large part of the shipments consist of ore containing less than 45 percent Mn. Small quantities (965 metric tons in 1938) of wad, together with some high-grade pyrolusite and psilomelane, were produced in the Krugersdorp district, Transvaal, for local consumption only.

*U. S. S. R.*—Data showing production in the U. S. S. R. in 1938 are not available. Two mining districts, Chiaturi and Nikopol, supply the bulk of the Russian output. Virtually all the Chiaturi ore is exported, while Nikopol supplies the bulk of the domestic consumption. Other deposits in the Urals and Western Siberia supply the remaining domestic requirements. Exports for the first 9 months of 1938 were 269,930 metric tons.

| Metallurgical | 598 | | |

World production of chromite in 1938 receded from the all-time peak established in 1937. Relatively small increases in output in Turkey and the Union of South Africa were more than offset by the drastic decreases in Southern Rhodesia and Cuba. Although complete data are not yet available it is doubtful whether the 1938 total will reach 1,000,000 long tons. Exports from all producing countries except Turkey were lower in 1938 than in 1937, reflecting the lower demand (principally in the United States).

Lower prices accompanied the sharp drop in demand, but, unlike 1937, ample supplies were available throughout the year. Imports into the United States decreased 36 percent, and delivery was suspended on some contracts to American consumers because of slack demand and stocks on hand. Exploration and development work continued in the Western States. One domestic consumer of chromite has been very active in the field during the past 2 years. The United States Chrome Mines, Inc., plans to expand production materially in 1939. Output is to come from Eldorado and San Luis Obispo Counties, Calif.

The following table compares the salient statistics of the chromite industry in the United States during the last 5 years with the yearly average from 1925 to 1929.

*Salient statistics of the chromite industry in the United States, 1925–29 (average) and 1934–38*

Figure 1 shows trends in consumption, prices, and domestic shipments during the past 14 years.

*Emergency stock pile.*—Chromite is listed by the War Department as one of the four mineral commodities constituting the first priority class for stock-pile reserves. Its importance is appreciated more readily when it is realized that the steel industry accounts for three-fourths of the domestic consumption. The strategic nature of

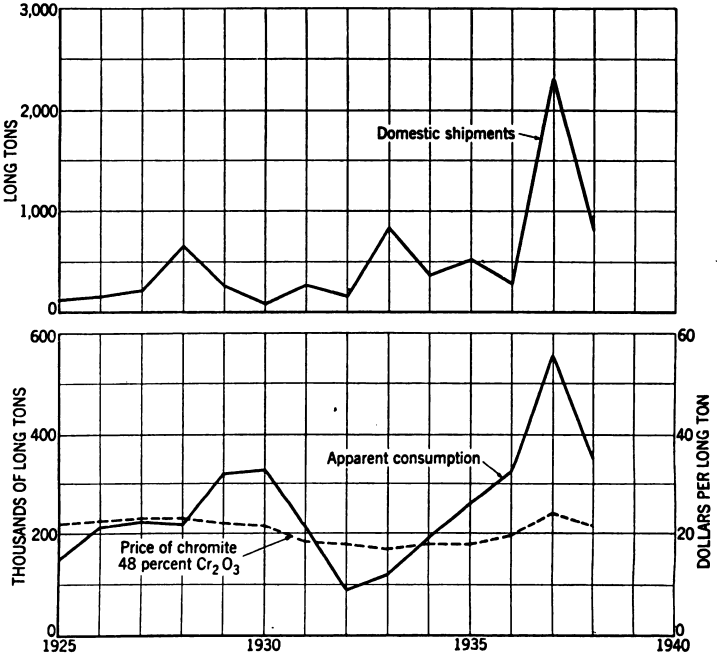

FIGURE 1.—Trends in consumption, price, and domestic shipments of chromite in the United States, 1925-38.

chromite is demonstrated in the following table, which shows domestic production, imports, and apparent supply from 1910 through 1938.

Several bills have been introduced into Congress looking to the purchase of stock piles of strategic materials, and hearings on the subject have been held by both the House and Senate military affairs committees. The Senate recently (April 3, 1939) passed a bill (S. 572) which provides $10,000,000 a year for the fiscal years 1940 to 1943 (the fiscal year ends June 30) for the purchase of strategic and critical materials. A similar bill (H. R. 5191) has been reported to the House by the House Military Affairs Committee. This bill, however, provides a total of $100,000,000 for four years.

During the past 2 years the Navy Department has received a small appropriation to provide stock piles of strategic commodities, and specifications and schedules for the purchase of 2,000 short tons of metallurgical chromite were released late in 1937. The bids were called for January 4, 1938, and a domestic producer was the lowest bidder. Accordingly he was awarded the contract, which called for delivery within 120 days. After two time extensions the producer

Digitized by Google

had not delivered and asked for a further extension which was not granted, so the contract was canceled. Bids were then called for February 23, 1939, and the award was made on March 14, 1939, to E. J. Lavino & Co., which will supply ore from Southern Rhodesia.

*Domestic production, imports, and apparent available supply of chromite in the United States, 1910–38, in long tons*

[3] According to the Division of Mines and Mining, Department of Natural Resources, California.

## DOMESTIC PRODUCTION

Domestic production, as measured by shipments from the mines, decreased from 2,321 long tons in 1937 to only 812 tons in 1938. The entire output came from California and was produced in Eldorado, Placer, and Napa Counties. With the exception of 2 carloads the 1938 output came from the United States Chrome Mines, Inc., in Eldorado County where a mill with a capacity of 200 tons a day has been installed. It was reported that shipments from this property in 1938 averaged 49 percent $Cr_2O_3$. Aside from production and development work in California, exploration was continued in other Western States. Certain features of characteristic deposits in California and Oregon have been described by Allen.[1] With regard to deposits in Oregon, Allen[2] has the following to say:

Chromite in Oregon occurs in the southwestern and northeastern parts of the State, in rocks of the peridotite or serpentine types. The deposits vary in form from thin stringers through narrow lenses to thicker and shorter kidneys and in size from a few inches up to masses whose outcrops are 40 feet in width and 150 feet or more in length. Only 11 of the deposits visited in Oregon had

[1] Allen, John Eliot, Geological Features of West Coast Chromite Deposits: Min. and Met., vol. 20, No. 386, February 1939, p. 100.
[2] Allen, John Eliot, Chromite Deposits in Oregon: Oregon Dept. of Geol. and Min. Ind. Bull. 9, 1938, p. 11.

Digitized by Google

individual kidneys of ore with visible outcrops larger than 5 feet wide and 10 feet long. When ore bodies occur in groups, which is common, individual masses often follow a recognizable scheme of orientation; they may be in line, staggered or overlapping, parallel, or irregularly placed with respect to each other. Nearly all the ore bodies are considerably broken and faulted, and they usually lie in a sheared and altered zone in the country rock.

The same publication also contains chapters entitled "The Present Commercial Aspect of Western Chrome Ores," by H. F. Byram, and "Preliminary Geophysical Investigation on the Sourdough Chromite Deposit in Oregon," by F. W. Lee.

Chromite is known to occur in the basic rocks of western North Carolina and northern Georgia, but there has been little or no production from this area since the World War. The Tennessee Valley Authority has investigated the deposits in this area, and Hunter [3] reports as follows:

> It is not practical under the present economic conditions to mine chromite from the small deposits in North Carolina and Georgia, but in case of necessity a limited amount of chromite can be quickly recovered from the several small deposits.

In connection with its program of devising low-cost methods of utilizing low-grade domestic sources of minerals, particularly strategic minerals, the Bureau of Mines has developed methods of concentrating western chromite ores and producing pure chromium chloride cheaply.[4]

*Chromite (ores and concentrates) shipped from mines in the United States, 1934–38*

[All from California except in 1937 as indicated]

[1] Included in total value; Bureau of Mines not at liberty to publish figures separately.
[2] Includes a small quantity of ore containing less than 35 percent chromic oxide.
[3] Ore containing 45 percent or more chromic oxide included with ore containing 35 to 45 percent.
[4] Includes 288 long tons of ore valued at $880 shipped from mines in Oregon, a small part of which contained 35 to 45 percent chromic oxide.
[5] A small quantity of ore containing 35 to 45 percent chromic oxide included with ore containing 45 percent or more.

## IMPORTS [5]

Imports of chromite in 1938 decreased 36 percent from the record total of 1937. This large decline was shared by all the principal sources except the Philippine Islands, from which imports increased 79 percent. The increase from the Philippines resulted from hold-over contracts and shipping on consignment, and much of the ore was in storage at the close of the year. The chromite imported in 1938 contained 46.5 percent chromic oxide. Of the principal imports

[3] Eckel, E. C., Hunter, C. E., and Mattocks, P. W., Iron, Chromite, and Nickel Resources of the Tennessee Valley Region: T. V. A. Geol. Bull. 10, April 1938, p. 20.

in 1938, those from New Caledonia had the highest content of chromic oxide (54 percent) and those from Cuba the lowest (32 percent).

[1] 60 pounds.

## CONSUMPTION

Owing to lack of data concerning consumers' stocks it is impossible to estimate accurately the total consumption of chromite in the United States. However, the apparent available supply decreased from the record total of 1937 but was larger than for any other year. Data since 1910 are given in a preceding table.

The steel industry consumes more than three-fourths of the supply of chromite either as a refractory or as the raw-material source of an

Digitized by Google

important alloying element. With the slump in the steel industry, a decline in the demand for chromite ensued. The domestic automobile industry, one of the important users of alloy steels and chromium plating, decreased its output from 4,809,565 cars in 1937 to 2,489,635 in 1938, the lowest since 1933. The construction industry uses stainless steel for decorative purposes and large quantities of chromium-plated plumbing fixtures. Activity in this field, which has been increasing since 1933, improved over 1937 but was only about three-fourths of the average annual volume from 1920 to 1929, inclusive.

## USES

Industrial uses of chromite fall into three groups: Metallurgical, refractory, and chemical.

*Metallurgical.*—Chromium is one of the principal elements used in the manufacture of alloy steel. For this purpose most of the chromite is converted to ferrochromium in the electric furnace before it is added to the steel bath, although one domestic concern makes chromium-alloy steels in the electric furnace directly from alloy-steel scrap, mild-steel scrap, and chromite. Although chromium is used in a number of alloy steels, its largest and best-known use is in the manufacture of stainless steels. A new process has been developed for introducing chromium into steel, permitting production of chromium steels in the open-hearth furnace as well as the electric furnace.[6]

In recent years chromium plating has had a wide field of uses and has become important industrially, but the amount of raw material consumed is small owing to the thinness of the layer of metal deposited.

*Refractory.*—Chromite with certain physical and chemical properties is used for refractories. Aside from its use in bricks, lump and ground chromite and chromite cements are used extensively in building and patching furnaces.

According to the Bureau of the Census the production of chrome and magnesite brick was 22,758,000 brick valued at $6,726,943 in1937 compared with 12,112,000 brick valued at $3,424,726 in 1935; stocks were 9,340,000 brick at the end of 1937 compared with 3,228,000 brick at the end of 1935.

Domestic trade-journal quotations for chromite brick dropped from $49 to $47 per short ton in May 1938.

*Chemical.*—In addition to the chromite used in the manufacture of chromic acid for electroplating, considerable chromite is consumed in chemicals employed principally in the dyeing, tanning, and pigment industries.

According to the Bureau of the Census the production of sodium bichromate and chromate was 48,697 short tons valued at $5,925,611 in 1937 compared with 42,325 tons valued at $4,762,728 in 1935. The production of chromic acid was 8,997,337 pounds valued at $1,260,477 in 1937 compared with 6,723, 304 pounds valued at $887,842 in 1935.

## PRICES

Prices of chromite quoted in the domestic trade journals are for imported ore and are given in dollars per long ton c. i. f. North Atlantic ports. The quotations are largely nominal. According to Steel, chromite containing 48 percent chromic oxide was quoted at $25.50 to

[6] Steel, Progress in Steelmaking: Vol. 104, No. 1, Jan. 2, 1939, pp. 314-315.

Digitized by Google

$26.50 at the beginning of 1938. Price decreases carried the quotation down to $23 to $24 during the last quarter of the year. Ore with a lower chromic oxide content usually brings a lower price.

## WORLD PRODUCTION

Complete data are not yet available on world output of chromite in 1938. The large drop in the output of Southern Rhodesia, the principal producer in 1937, probably will result in a lower world figure in 1938 than in 1937 despite increases in some other countries. Excluding the U. S. S. R., for which no data are available for 1937 and 1938, Turkey was the largest producer in 1938, followed by Southern Rhodesia and the Union of South Africa.

## WORLD TRADE

Except for the U. S. S. R. the principal producing countries consume only small quantities of chromite, and the major consuming countries produce only a small fraction of their requirements. The bulk of the chromite produced thus enters international trade. World exports were lower in 1938 than in 1937 when a record figure was established. Turkey, Southern Rhodesia, and the Union of South Africa were the principal exporters.

Figures on imports of chromite into consuming countries are not yet complete, but available data indicate that the three principal importing countries, in order of quantity, were the United States, Germany, and Norway.

A brief summary of the activities in the principal chromite producing and consuming countries follows.

*Canada.*—A small quantity of chromite is produced annually in the Thetford-Black Lake area of the Eastern Townships of Quebec, but no shipments were reported for 1938. The Asbestos Corporation of

Digitized by Google

Canada has been mining chromite at one of its properties in the Thetford asbestos field, southern Quebec. Development work on the property at Obonga Lake near Collins, Ontario, by the Chromium Mining & Smelting Corporation did not reveal a deposit of economic importance. The company, however, is proceeding with its metallurgical developments using ore from foreign sources. The process, it is claimed, permits production of low-carbon ferrochromium from low-grade chromite.

*Cuba.*—The entire Cuban output moves to the United States; imports into the United States from Cuba in 1938 were 40,163 metric tons compared with 94,592 tons in 1937. Cuban ores have a low content of $Cr_2O_3$ and are used in the refractory industry.

*Cyprus.*—The milling plant of the Cyprus Chrome Co., Ltd., at Ayios Nikolaos was completed about the middle of 1937. Owing to technical difficulties and the necessity of installing additional machinery, the plant was not in full operation at the beginning of 1938, but a trial shipment of about 500 tons of concentrates in 1937 averaged 51.2 percent $Cr_2O_3$. Concentration is done on magnetic separators, wet classifiers, and tables, and the plant is reported to have a capacity of 50 tons of concentrates per day. Known reserves at the Kokkinorotsos mine were increased as a result of development work.

*France.*—France depends on foreign sources for its domestic requirements. Imports in 1938 totaled 40,178 metric tons of which 3,305 came from French colonies compared with 38,171 tons with no shipment from the colonies in 1937. New Caledonia is the only French colony where any appreciable amount of chromite is found, but recently occurrences of chromite have been reported in Dahomey.[7]

*Germany.*—Germany does not produce chromite. Imports were 176,406 metric tons in 1938 compared with 132,162 tons in 1937. Of the 1938 total, 34 percent came from the Union of South Africa and 30 percent from Turkey. Chromite trade between the Union of South Africa and Germany may be expanded as a result of a trade agreement between the two countries concluded late in 1938.

*Greece.*—Exports of chromite from Greece were 35,661 metric tons in 1938 compared with 55,945 tons in 1937. Of the 1938 total, 18,160 tons went to Germany compared with 11,245 tons in 1937. The principal mines are those of the Société Union Minière at Xinia, northwest of Lamia, and of A. Apostolides at Tsagli, west of Volos.

*India.*—Production data for India in 1938 are not yet available, but exports showed a large decline. Water-borne exports dropped sharply to 18,506 metric tons in 1938 from 37,680 tons in 1937; however, these figures do not include exports through Mormugao, which amounted to 13,495 tons in 1937. The largest output comes from Baluchistan and Mysore State. The chief mines in Baluchistan are near Hindubagh in the Zhob Valley.

*New Caledonia.*—Preliminary figures show that exports of chromite from New Caledonia in 1938 were 39,780 metric tons compared with 69,753 tons in 1937. A large part of the New Caledonian ore comes from two mines, the Tiebaghi mine operated by British interests and the Fantouche mine operated by American interests. New Caledonian ores are of high grade.

[7] Chermette, A., Le Gisement de chromite de Bontomo, Haut-Dahomey: Service des Mines, French West Africa, Bull. 1, 1938, pp. 69-73.

Digitized by Google

A new mining company, known as the Société d'Exploitation de la mine Chagrin, with a capital of 500,000 francs has been organized in New Caledonia for the purpose, among other things, of acquiring and operating the Chagrin chromite mine.

*Norway.*—Imports of chromite into Norway in 1938 increased to 50,023 metric tons from 32,718 tons in 1937. Much of the chromite sent to Norway is smelted into ferrochromium, because of the available electric energy, and exported. Exports of ferrochromium, however, decreased to 11,603 tons in 1938 from 14,883 tons in 1937.

*Philippine Islands.*—The declining chromite market affected adversely the new chromite mining industry in the Philippines. Most of the ore comes from three mines, the Florannie, the Acoje, and the Consolidated. The first two mines yield ore that is shipped to metallurgical consumers, while the third mine yields a product low in $Cr_2O_3$ but high in $Al_2O_3$, which is shipped to manufacturers of refractory materials. The Florannie and Consolidated mines are operated by the Benguet Consolidated Mining Co., and Acoje is a Marsman property. Despite unfavorable market conditions, work at Florannie continued throughout the year in an effort to exhaust the ore body and withdraw. At the end of the year, according to the company report, only 1,500 tons remained in the mine. Production in 1938 was 20,982 tons. Operations at Consolidated, which amassed a stock of 25,000 tons, were suspended in May due to lack of orders. Exports from the Philippines in 1938 were 66,911 metric tons compared with 69,856 tons in 1937.

*Southern Rhodesia.*—Output in 1938 decreased 33 percent from the record figure in 1937 and amounted to 186,019 metric tons. Exports were 117,300 tons for the first 6 months of 1938.

Present output comes from two districts (the Selukwe district and along the great dike). Foremost among the Rhodesian chromite deposits are those in the Selukwe district where, at present, three mines are producing.[8] These are the Railway Block, the Selukwe Peak, and the Iron Peak. They are situated 1½, 8, and 4 miles, respectively, from Selukwe. Most of the ore mined from underground workings is extracted by top slicing. The bulk of the ore is shipped direct after hand sorting and blending. Only a small proportion is treated; concentration is accomplished by classifiers, jigs, and tables.

Much of the Rhodesian output is controlled by a British syndicate. Early in 1938 the independent producers formed an association to facilitate marketing of their outputs.

*Sweden.*—Imports of chromite into Sweden decreased from 71,821 metric tons in 1937 to 49,627 tons in 1938. Exports of ferrochromium from Sweden were 13,124 tons in 1937.

*Turkey.*—Despite the apparent curtailment in world output of chromite in 1938, the production of Turkey continued to climb. Output may have exceeded 200,000 metric tons for the first time. Virtually all the ore is exported as there is little or no domestic demand; exports in 1938 were 208,055 metric tons, an increase of 5 percent over the 198,459 tons exported in 1937.

The principal producers of chromite in Turkey are the Société Anonyme Turque des Chromes de l'Est a Guleman (State), Société Miniere de Fethiye (French), Société Turque de Minerais (Swiss-

[8] Musgrave, J., Chrome Mining at Selukwe, Southern Rhodesia: Trans. Inst. Min. and Met., Nov. 17, 1938, pp. 1–16.

Digitized by Google

German), and Société Anonyme Turque de Chrome (Turkish). In addition there are several small companies. Production continued at the newly developed deposits at Guleman some 20 miles from the railroad at Ergani. An aerial tramway connects the mines with the Ergani-Diyarbekir Railway, and the ore is transported by rail to the port of Mersin. The district is rapidly becoming one of the most important chromite-mining centers in the world. Although most of the chromite is destined for export, plans call for the installation of a plant at Kutahya for the manufacture of ferrochromium. The following are typical analyses of commercial chromite exported from the Guleman district:

| | *Percent* | |
|---|---|---|
| $Cr_2O_3$ | 49.00 | 52.00 |
| $SiO_2$ | 2.00 | 2.25 |
| FeO | 10.00 | 10.75 |
| MgO | 16.00 | 18.00 |
| $Al_2O_3$ | 16.00 | 17.00 |

*Union of South Africa.*—Output in the Union of South Africa likewise increased in 1938 when a record production of 183,570 metric tons was recorded—9 percent more than the 1937 total. Exports, however, declined appreciably and were 117,562 tons in 1938 compared with 169,537 tons in 1937. Reductions in railway freights to the ports have aided the competitive position of South African chromite.

*U. S. S. R.*—The U. S. S. R. is one of the largest producers of chromite. Output in recent years has been increasing and in 1936 was 217,000 metric tons; figures for 1937 and 1938 are not yet available. Exports are small as the output is consumed in domestic industries.

*United Kingdom.*—Imports of chromite into the United Kingdom in 1937 were 45,573 metric tons. The imports are used in the chemical and refractory industries, as no ferrochromium is made in the United Kingdom. Imports of ferrochromium, largely from Norway and Sweden, were 10,654 tons in 1938 compared with 18,432 tons in 1937.

*Yugoslavia.*—Production in Yugoslavia in 1938 was 51,000 metric tons, and exports were 23,310 tons. The Allatini Mines, Ltd., the principal producer, operates the mines at Orasje, 26 kilometers northwest of Skoplje.

## NICKEL

The demand for nickel in the United States in 1938 was adversely affected by the substantial recession of activity in the iron and steel industry, which uses the major portion of nickel. There was also a marked decline in the demand for nickel in most other outlets Precise data on domestic nickel consumption are not available, but the 1938 total may be estimated roughly to have been 22,000 short tons, a decrease of about 50 percent from 1937. As usual, domestic production of primary metal was insignificant (416 short tons), and the output of secondary nickel totaled only 2,300 short tons. The domestic supply was derived chiefly from imports, largely from Canada. Domestic quotations for electrolytic nickel remained unchanged at 35 cents a pound throughout 1938.

In contrast to the marked reduction in the United States, consumption in Europe and elsewhere showed little change in 1938; consequently, world consumption (estimated at 102,000 short tons in 1938) was only about 16 percent less than in 1937

Canada furnished about 88 percent of the world's nickel The International Nickel Co. of Canada, Ltd , alone supplied more than 80 percent of the total nickel used in 1938.

*Salient statistics for nickel, 1936–38*

| | 1936 | 1937 | 1938 |
|---|---|---|---|
| United States: | | | |

Digitized by Google

Search for commercial deposits of nickel in the United States was under way in 1938, and prospecting and development were reported at several localities. Allsman [2] describes the mining of 55 tons of nickel-bearing rock from a prospect in southern Nevada by hand methods. The geology, mineralogy, and problems related to future development also are discussed briefly. Preliminary work on copper-nickel ores from the Bunkerville (Nev.) district was begun at the Boulder City laboratory of the Bureau of Mines. The nickel deposits at Webster and Democrat, N. C., are discussed in a recent report by the Tennessee Valley Authority.[3]

Because of the interest that has been centered lately on strategic and critical minerals from a military standpoint, as well as the fact that nickel has been classed by the Army and Navy Munitions Board as a strategic mineral, it seems fitting at this time to present a historic table comprising data on production and consumption since 1911.

*Production, imports, exports, and apparent consumption of nickel in the United States, 1911–38, nickel content in short tons*

| Year | Primary | | | | Secondary production |
|---|---|---|---|---|---|
| | Domestic production (byproduct of copper refining) | Imports | Exports | Apparent consumption | |
| 1911 | 445 | 14,915 | 12,350 | 2,810 | [1] |

[4] Nickel content estimated.

## PRODUCTION

Domestic production of nickel includes only minor quantities of secondary metal recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal) and small quantities of primary metal recovered in copper refining, as shown in the following table. Further details on the production of secondary nickel are given in the chapter on Secondary Metals.

## IMPORTS AND EXPORTS

The principal nickel imports of the United States are metallic nickel and nickel alloys, ore and matte (chiefly matte containing approximately 55 percent nickel and 25 percent copper), and nickel oxide. All the oxide, virtually all the ore and matte, and 98 percent of the metallic nickel and alloys were obtained from Canada in 1938; Europe supplied the remainder of the ore, matte, and metallic nickel and alloys. The matte is refined to Monel metal and other products at the plant of the International Nickel Co., Inc., Huntington, W. Va.

Exports consist largely of products manufactured from imported raw materials; Europe is the principal market.

## WORLD ASPECTS

*World production.*—World nickel production in 1938 may be estimated roughly at 109,000 metric tons, or about 5 percent less than in 1937 Canada decreased its output 6 percent but supplied about 88 percent of the total. The output in New Caledonia, the second largest producer, was about the same as in 1937.

*World production of nickel (content of ore), 1934–38, by countries, in metric tons*

[Compiled by R. B. Miller]

| Country | 1934 | 1935 | 1936 | 1937 | 1938 |

[1] Data not yet available.
[2] Excludes small quantity produced in British Columbia.
[3] Less than 1 ton.
[4] Estimated.
[5] Byproduct in electrolytic refining of copper.

*World consumption.*—The London Mining Journal (March 4, 1939, p. 173) estimates world consumption of nickel in 1938 as follows:

| | *Metric tons* | | *Metric tons* |
|---|---|---|---|
| United States | 23,400 | Italy | 3,600 |
| U. S. S. R. | 17,300 | Sweden | 2,500 |
| United Kingdom | 13,200 | Czechoslovakia | 2,000 |
| Germany (including Austria) | 12,200 | Other countries | 3,100 |
| Japan | 9,100 | | |
| France | 6,100 | | 92,500 |

The foregoing figures indicate gains over 1937 of 1,000 tons each for Japan, France, and Italy and 500 tons each for Sweden and Germany, but losses of 17,000 tons for the United States, 1,000 tons each for the U. S. S. R. and the United Kingdom, and 500 tons for Czechoslovakia.

## REVIEW BY COUNTRIES

*Burma.*—The nickel produced in Burma is derived from a nickel-bearing speiss made by the Burma Corporation, Ltd., at Namtu in the Northern Shan States. The speiss, containing approximately 30 percent nickel, 8 percent copper, and 7 percent cobalt, as well as 17 ounces of silver to the ton, is shipped to Hamburg for further treatment.

*Canada.*—Virtually all the Canadian output is derived from the copper-nickel ores of the Sudbury district, Ontario; and two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Production in Canada was 105,337 short tons valued at $53,949,311 in 1938 compared with 112,453 tons valued at $59,507,176 in 1937.

Digitized by Google

The International Nickel Co. of Canada, Ltd.,[4] operated at a slightly reduced scale throughout 1938. Four mines—Frood (3,497,846 tons), Creighton (1,092,155 tons), Levack (814,513 tons), and Garson (380,780 tons)—produced 5,785,294 short tons of ore. Proved ore reserves at all Canadian mines of the company were 212,368,000 tons containing 6,806,000 tons of copper and nickel on December 31, 1938, compared with 6,739,000 tons of copper and nickel in the reserves on December 31, 1937.

The concentrator treated 4,519,652 tons of ore in 1938. The Port Colborne nickel refinery produced 62,117 tons of refined nickel in 1938. Sales of nickel in all forms were 82,189 tons in 1938 (103,850 tons in 1937).

Falconbridge Nickel Mines, Ltd., [5] operated at a higher rate than in 1937 and treated 490,938 tons of ore (438,629 tons in 1937), comprising 252,866 tons of milling ore and 238,072 tons of smelting ore. The ore, which averaged 1.81 percent nickel and 0.95 percent copper in 1938, is smelted in Canada and the matte shipped to Norway for refining. Ore reserves were 6,881,000 tons averaging 1.80 percent nickel and 0.97 percent copper on December 31, 1938, compared with 6,333,000 tons containing 1.82 percent nickel and 0.89 percent copper on December 31, 1937.

*Finland.*[6]—The mine development program at Petsamo of the Petsamon Nikkeli O/Y is progressing satisfactorily. An adit 8,580 feet long, driven to reach the ore body, was completed in January 1939, and it is expected that the vertical shaft (680 feet deep) will connect with the adit early in 1939. Many of the surface buildings, such as shops, storehouses, and workmen's dwellings, have been built and construction of the smelting plant is actively under way. A hydroelectric power development is under way to provide power for the operation of the Kaulatunturi mine and the smelting plant. Barring unforeseen emergencies the mine, smelter, and hydroelectric power station will begin production by the autumn of 1940.

*Germany.*[7]—Owing to the low grade of its ore and resultant unprofitable exploitation, Germany's only nickel mine, at Frankenstein, Silesia, remained idle for many years, and its operation was revived only in 1935 and 1936, when it furnished a small output of nickel—200 and 450 metric tons, respectively. In 1937 production was 87,000 metric tons of nickel ores. Intensive exploitation during the World War reduced the nickel content of the Frankenstein deposits from 2.5 to only 1 percent, and it was only with the development of the improved "Renn" process by the Krupp Co. that a resumption of exploitation of the deposits was made practicable in 1935. Availability of the Renn process has caused interest to be revived in nickel deposits in other parts of Germany, notably those at Horbach near St. Blasien, Baden.

*Japan.*—Since Japan has been making all possible efforts to be independent of imports of nickel, reports frequently have appeared in the press of the discovery of deposits supposed to be of such richness and extent as to challenge the supremacy of the Sudbury district (Ontario), but such reports no doubt reflect wishes rather than actual discoveries.

The Nippon Nickel Co. is the only firm in Japan to refine metallic nickel from domestic ores.[8] It is reported that company prospectors recently discovered a deposit of 2 to 3 percent ores. Those currently worked contain only 0.3 to 0.88 percent nickel.

The Nippon Kogyo Kaisha is producing nickel by importing the ore from New Caledonia.

The Toho Kinzoku Seiren Kabushiki Kaisha has been organized and plans to erect a refining plant capable of producing 2,100 metric tons of nickel and 20 tons of cobalt annually. Nickel ore will be obtained from Southern Rhodesia.[9]

*Netherland India.*—It is reported [10] that the Oost-Borneo Maatschappij has shipped about 20,000 tons of nickel ore from the newly opened Celebes mines to Krupp in Germany, where the ore is to be tested for its adaptability for treatment by certain metallurgical processes.

*New Caledonia.*—Exports of crude ore (4 to 6 percent nickel content) increased to 30,810 metric tons in 1938 from 17,960 tons in 1937, but shipments of matte (about 77 percent nickel content) declined to 5,932 metric tons from 6,830 tons. Figures for 9 months indicate that Japan took nearly 55 percent and Germany 45 percent of the ore exported in 1938; a small amount went to Belgium. All the matte was shipped to France and Belgium.

*Norway.*—The Falconbridge refinery at Kristiansand operated steadily and normally throughout 1938 on matte from the Falconbridge smelter near Sudbury, Ontario, Canada, and on some custom matte. It produced 8,213 short tons of nickel (7,429 tons in 1937) and 4,125 tons of copper (3,820 tons in 1937). In 1938 sales of nickel were 7,142 tons (6,621 tons in 1937) and of copper 3,854 tons (3,115 tons in 1937).

*Southern Rhodesia.*—According to the Mining Journal: [11]

> Nickel was produced in small quantities from the Noel Nickel Mine, Gwanda. This property is now being worked by a strong mining company, and it is the intention of the company to put in a production plant with a capacity of from 200 to 300 tons of ore per day. Meanwhile, the fuller prospecting and development of the property is being pushed ahead with all speed.

*Union of South Africa.*—The new plant at Rustenburg Platinum Mines, Ltd., which began operation in 1937, produced matte containing 40 percent nickel, 25 percent copper, and 35 ounces of precious metals per ton in 1938.[12]

*U. S. S. R.*[13]—During the past 5 or 6 years Soviet geologists and mining engineers have been prospecting the Kola Peninsula, the Moncha district in particular. Deposits of iron, copper, and nickel ores, as well as occurrences of gold, platinum, cobalt, and other metals, were located. Especially interesting nickel ore deposits, said to be very rich, have been found in two localities called Nittis and Kumujie. Construction of a plant for refining this ore was started a few years ago at Monchagorsk (the town of Moncha); it was completed in October 1938 and has started to produce nickel. It can produce 2,500 tons of metal annually, provided a daily supply of 500 tons of ore is available. The present state of nickel ore mining in

Digitized by Google

the Nittis-Kumujie district has been disappointing, however, and instead of the 500 tons contemplated, hardly 200 tons daily are being mined.

The refinery at Ufalei, opened 4 years ago, produces some 1,500 tons of nickel per annum. A third refinery will be constructed in the South Urals district, where nickel ore deposits are considered by the Soviet experts to be of very rich nickel content.

*United Kingdom.*—The Clydach nickel refinery of the Mond Nickel Co., Ltd., produced 21,981 short tons of nickel in the form of pellets in 1938 (19,777 tons in 1937) and 1,224 tons of nickel in salts (1,215 tons in 1937).

## COBALT

Consumption of cobalt in the United States in 1938, as indicated by imports, declined substantially; and, as in the past, the demand was supplied entirely by imports, as there was no domestic output. Total imports decreased about 28 percent. Despite the decreased demand, domestic quotations were unchanged—97 to 99 percent metal from Belgium in lots of 100 pounds or more was $1.36 a pound and black oxide (70 to 71 percent grade) in lots of 350 pounds or more, $1.67 a pound.

World production may be roughly estimated at 4,500 metric tons in 1938 compared with 3,800 tons in 1937. Outputs in Burma and Canada declined moderately, but production in French Morocco and Northern Rhodesia increased substantially. A small quantity was produced in Chile in 1938.

World consumption of cobalt was estimated by the London Mining Journal (Mar. 4, 1939, p. 175) at 3,100 tons in 1938 compared with 3,000 tons in 1937.

### PRODUCTION

There was no marketed production of cobalt from domestic deposits in 1938. A western electrolytic-zinc plant recovered 16 short tons of residue containing 3.3 percent cobalt, but no shipments were made.

The United States, a large consumer of cobalt, has thus far failed to develop substantial supplies, but recent developments raise the hope that this country may yet produce cobalt in commerical quantities. Experiments on recovery of cobalt from the iron ores mined at Cornwall, Pa., were carried on during 1938. Cobalt, which has long been known to occur as a minor constituent of these iron ores, has been found in increased amounts in the ore bodies now being mined. Substantial values in cobalt, nickel, and platinum have been reported discovered associated with the molybdenite near Porthill, Boundary County, Idaho, and two flotation machines to separate these metals have been installed. In the Tombstone district, Ariz., development was continued in 1938 on a prospect from which a small quantity of ore reported to contain 1 to 7 percent cobalt was produced (but not sold) in 1937. Near Keating, Oreg., development was in progress at a deposit reported to contain cobalt and nickel.

### FOREIGN TRADE

A feature of the import trade in 1938 was the marked increase in receipts of metal from Canada and Finland and receipts of 17,783 pounds of ore from the recently reopened mines in Chile. After advancing progressively for several years, imports of cobalt dropped

Digitized by Google

considerably in 1938. Total imports of cobalt decreased approximately 28 percent in 1938 compared with 1937. Imports of ore declined 23 percent, metal 13 percent, and oxide 56 percent. Exports of cobalt and cobalt products are not reported separately, but they are believed to be relatively unimportant.

*Cobalt ore, metal, and oxide imported for consumption in the United States, 1937–38, by countries, in pounds*

## USES

Increasing world production, assurance of adequate supplies, and extensive research investigations have been important factors in expanding the use of cobalt. Cobalt oxide is used in the ceramic industry and as a catalyst; cobalt salts in the preparation of driers for use in paints, varnishes, and linoleums; and cobalt metal in various types of high-grade steels (especially metal-cutting and magnet steels), as a catalyst, and in electroplating processes.

According to the London Mining Journal (Mar. 4, 1939, p. 175) the cobalt industry maintained its position during 1938 chiefly because of the demand for the metal in the catalytic synthesis of hydrocarbons from mixtures of carbon monoxide and hydrogen, for which purpose it is extensively used in the Fischer-Tropsch reaction to give a wide range of *n*-paraffins. The metals that form the basis of active catalysts for the Fischer-Tropsch reaction are iron, nickel, and cobalt.

Special cobaltized salt for incorporation in salt licks for cattle and sheep is now being prepared in New Zealand.[14] It contains 4 ounces

[14] Bulletin of the Imperial Institute, vol. 36, London, October-December 1938, p. 511.

Digitized by Google

of cobalt sulfate to 18¾ pounds of salt, with 1 pound of hematite added to color it bright red. This is intended to be used at the rate of 1 pound to 1 hundredweight of agricultural salt, the red color forming a guide to the completeness of the mixing.

## WORLD PRODUCTION

Lack of statistics on the production of cobalt in the Belgian Congo, one of the chief producers, and in several smaller producing countries precludes an accurate statement on total world output. Estimating the output of Belgian Congo very roughly at 1,500 metric tons in 1938, world production of 4,500 tons is indicated. Substantial increases in production were recorded in French Morocco and Northern Rhodesia, but output declined moderately in Burma and Canada.

The chief cobalt deposits of the world are described briefly in a recent article by More.[15]

*World production of cobalt, 1936–38, in metric tons*

[Compiled by M. T. Latus]

| Country [1] | Cobalt-bearing material | 1936 | | 1937 | | 1938 | |
|---|---|---|---|---|---|---|---|
| | | Gross weight | Cobalt content | Gross weight | Cobalt content | Gross weight | Cobalt content |
| Belgian Congo | Cobaltiferous copper ore | (2) | 685 | (2) | 1,500 | (2) | (2) |
| Bolivia | Cobalt ore | | | 5 | (2) | (2) | (2) |
| Burma [4] | Cobaltiferous nickel speiss | [5] 4,669 | 214 | 4,389 | 298 | 3,399 | 238 |
| Canada: Ontario | Cobalt, alloys, and chemicals | (2) | 403 | (2) | 230 | (2) | 208 |
| Morocco, French | Cobalt ore [6] | 3,370 | 371 | 5,280 | 581 | 6,540 | 719 |
| Northern Rhodesia | Cobaltiferous copper ore | (2) | 461 | (2) | 884 | (2) | 1,461 |

[1] In addition to the countries listed, Chile, China, Finland, Germany, Japan, and Mexico produce cobalt, but production data are not available.
[2] Data not available.
[3] Less than 1 ton.
[4] Year ended June 30 of year stated.
[5] In addition, 5 tons of cobalt ore containing 14.4 percent cobalt and 5 tons of speiss containing 22.13 percent cobalt were reported from Nepal during the calendar year.
[6] Average cobalt content estimated at 11 percent.

*Belgian Congo.*—The Belgian Congo is one of the largest sources of cobalt, but accurate details of production are not available. The copper ores that contain cobalt are divided into two classes. One type, containing about 4 percent cobalt and 18 percent copper and iron, is treated in a water-jacketed furnace and an electric furnace to give a ternary alloy containing 30 percent cobalt, 40 percent iron, and 26 percent copper. The other class of ore is rich in cobalt and is sent directly to the electric furnace to obtain the same type of product.

Production of cobalt by the Union Minière du Haut Katanga was 1,500 metric tons in 1937 compared with 685 tons in 1936.[16] The cobalt-producing capacity of Union Minière du Haut Katanga has been increased considerably by the discovery of further reserves of rich cobalt minerals.[17] A fourth electric furnace for the treatment of cobaltiferous minerals has been installed at the Jabotville-Panda works.

Digitized by Google

*Burma.*—Cobalt production of Burma is derived largely as a by-product of lead-zinc mining at the Bawdwin mines of the Burma Corporation, Ltd. A nickel speiss obtained at the lead smelter contains about 7 percent cobalt. It is shipped to Hamburg for treatment.

*Canada.*—Canadian production of cobalt includes the cobalt in ores and concentrates exported from northern Ontario, cobalt metal produced by the Deloro Smelting & Refining Co., Ltd., Deloro, Ontario, and the cobalt contained in cobalt oxide produced by the same company. The total output amounted to 459,060 pounds valued at $788,576 in 1938 compared with 507,064 pounds valued at $848,145 in 1937.[18] Exports of cobalt alloys, metal, oxides, and ores were valued at $765,580 in 1938 compared with $909,140 in 1937.

Increased amounts of cobalt and nickel minerals have been reported found on the lower mine levels at Great Bear Lake, Northwest Territories.[19]

*Chile.*—A small production of cobalt was reported in Chile in 1938. According to Faust: [20]

> During the period between 1899 and 1906, three small mines, known as Rosa Amelia, Blanca, and Despreciada, near Puerto del Huasco in the Province of Atacama, produced 905 metric tons of hand-picked cobalt ore averaging 6.37 percent cobalt. About 18 months ago, the Compañia Minera "La Cobaltera" began to reopen the mines. The company expects to make its first shipment in June, the shipment to consist of 14 to 18 tons of hand-picked mineral containing approximately 12 percent of sulfarsenide of cobalt (cobaltite, CoAsS).
>
> Various pockets of ore containing up to 18 percent cobaltite have been opened, but the average material as it comes from the mine contains approximately 1.75 percent cobalt and 0.30 percent nickel. The company expects to concentrate 20 tons of this ore by the gravimetric method to obtain approximately 3 tons of 15 percent material daily. The flotation method will be adopted at a later date.
>
> There are at present three shafts—118, 49, and 47 meters deep. Sixty-eight workmen are now employed, and it is understood that this force will be increased in the near future.

*Finland.*—Finland became a producer of cobalt recently, but figures on output are lacking. Imports of cobalt metal into the United States from Finland increased to 240,575 pounds in 1938 compared with 147,800 in 1937.

In the Outokumpu copper mine, in eastern Finland, approximately 0.2 percent cobalt, 0.1 percent nickel, and 26 percent iron are associated with a 4-percent copper ore.[21] Prior to 1936 the copper concentrates were exported, but they are now sent to the smelter erected at Imatra in southern Finland.

*Germany.*—Output of cobalt in Germany will be increased by the resumption of operations of an old mine at Schneeberg, Saxony, formerly an important cobalt producer, as well as by exploitation of cobalt deposits in Wittichen and in the southern Black Forest, according to a report submitted by the American consulate general at Frankfort on the Main under date of May 14, 1938. In recent years Germany's production of cobalt, amounting to about 17 metric tons annually, was obtained as a byproduct of the Mansfeld copper shale deposits in Central Germany, but with the now developing exploitation of these cobalt deposits, output will suffice to supply the great bulk of Germany's requirements of around 100 metric tons a year.

Digitized by Google

*Morocco, French.*—Cobalt made its first appearance in the mineral statistics of French Morocco in 1932, when 63 metric tons were recovered. Since that time production has advanced almost steadily and reached a peak of 719 metric tons in 1938.

*Northern Rhodesia.*—The Rhokana Corporation, Ltd., sold 831 short tons of cobalt in alloys and refined products during the year ended June 30, 1938, compared with 730 tons during the corresponding year 1937. Production increased to 1,461 metric tons in the calendar year 1938 compared with 884 tons in 1937. A third electric furnace, increasing capacity for treating converter slags by 50 percent, was added to the cobalt plant. A plant for the differential flotation of copper and cobalt to obtain a rich cobalt concentrate has also been installed.

## MOLYBDENUM

The output of molybdenum, unlike that of most other industrial metals, increased in 1938, thereby continuing its remarkable progress. Although record production figures were established, consumption was not as high as in 1937, when record steel output plus extensive armament activities pressed production facilities to meet demand. In consequence, some stocks accumulated at mines during 1938. In this country, the predominant producer, output of molybdenum in the form of concentrates exceeded shipments by 7,500,000 pounds—an amount equivalent to about 30 percent of the total shipments. Stocks at the beginning of 1938, however, were small.

Of the record world output of 36,000,000 pounds of molybdenum in 1938, the United States supplied 33,297,000 pounds (92.5 percent); thus, the United States furnishes the bulk of the world's molybdenum. The relatively small amount produced by other countries came mainly from Mexico and Norway; output in Mexico was less in 1938 than in 1937, but production in Norway increased. Molybdenum is one of the few ferro-alloying elements of which this country has ample supplies for its own needs.

Exports of molybdenum from the United States are not known exactly, since they are not classified separately in trade statistics, but they are believed to comprise 50 to 75 percent of the domestic production.

The Climax mine of the Climax Molybdenum Co. is the principal producer of molybdenum, having furnished about 78 percent of the world output and 85 percent of the domestic output in 1938. New capacity added in 1937 permitted 12,000 short tons of ore to be milled per day in 1938. Output of molybdenite concentrates from the copper ores of the Utah Copper Co. at Bingham, Utah, and of

[1] Figures on imports and exports compiled by M. B. Price, of the Bureau of Mines, from records of the Bureau of Foreign and Domestic Commerce.

Digitized by Google

the Nevada Consolidated Copper Corporation at Chino, N. Mex., continued during the year. As this output is entirely byproduct and depends on the rate of copper operation, production dropped in 1938. Of interest during the year were the initial production and shipment of molybdenite concentrates from the copper operations of the Miami Copper Co., Miami, Ariz.

Activities in the search for and development of molybdenum deposits in various parts of the world continued in 1938.

*Salient statistics of the molybdenum industry in the United States, 1936–38* [1]

[1] Figures for molybdenum exported not separately recorded.
[2] Excludes copper ore yielding molybdenite concentrates from New Mexico and Utah in 1937 and Arizona, New Mexico, and Utah in 1938.
[3] Estimated by Bureau of Mines.

## PRICES

Prices for molybdenite concentrates carrying 90 percent $MoS_2$ were quoted nominally by the Engineering and Mining Journal at 42 cents per pound of contained $MoS_2$ from January 1, 1938, until late in March, when the quotation rose to 45 cents where it remained for the rest of the year; however, London prices for the same grade of concentrates decreased during the year. In January 1938 the quotations were 47s. per long ton unit. Lower quotations reduced the figure to 41–42s. late in December. This price drop was equivalent to a decrease from 52 cents per pound in January to 43 cents in October.

## DOMESTIC PRODUCTION

*Alaska.*—The Kennecott Copper Corporation abandoned its development work on the molybdenum prospect near Valdez in the Copper River Valley during 1938.

*Arizona.*—Five mines in Arizona produced 4,784 short tons of concentrates containing 1,139,593 pounds of molybdenum in 1938.

The largest producer, the Arizona Molybdenum Corporation, which operates a property near Mammoth, Pinal County, treated 79,333 short tons of ore during 1938, from which 537 tons of concentrates containing 607,605 pounds of molybdenum were recovered. The mine was shut down late in the year, but the mill continued to operate on the tailings supply. The reopening of the mine will depend on results of further exploration and development.

The Molybdenum Gold Mining Co., a subsidiary of the Molybdenum Corporation of America, continued to mine complex ore from the oxide zone in the Mohawk and New Year claims near Mammoth. The mine-run ore goes to the nearby mill of the Mammoth-St. Anthony, Ltd., where gold, silver, lead, molybdenum, and vanadium are

Digitized by Google

recovered by selective flotation. The latter company also treats a similar ore from its nearby Mammoth mine. In 1938, the mill produced 4,191 short tons of concentrates containing 481,156 pounds of Mo. The geology and ore deposits of this area have been described by Peterson.[2]

The Miami Copper Co. reported the recovery and shipment in 1938 of a small quantity of molybdenite concentrates resulting from the re-treatment of copper sulfide concentrates at Miami, Gila County.

*Colorado.*—The Climax Molybdenum Co., the world's largest producer of molybdenum, operated its mine and mill at capacity throughout 1938, having mined 4,344,734 short tons of ore containing 0.606 percent $MoS_2$ from which 27,591 short tons of concentrates containing 28,242,085 pounds of molybdenum were recovered. Production exceeded shipments, permitting some stock of concentrates to be built at the mine. Output at this property has increased nearly six times during the past 6 years, as shown in the following table.

*Molybdenum (element) contained in concentrates produced from the Climax deposit, Colorado, 1933–38*

| | Pounds | | Pounds |
|---|---|---|---|
| 1933 | 5, 028, 695 | 1936 | 15, 216, 806 |
| 1934 | 8, 378, 683 | 1937 | 22, 750, 368 |
| 1935 | 10, 168, 635 | 1938 | 28, 242, 085 |

The building program, which included mill enlargement, hotel, hospital, houses for employees, street work, and sewer and water-pipe installation, was completed early in 1938.[3]

Other development work and discoveries were reported from Colorado in 1938, but Climax was the only producer.

*Idaho.*—The International Molybdenum Co. made a small production, but no shipments, in connection with the development of its property near Porthill in Boundary County. Additional flotation equipment was installed in 1938. The ore at this property also contains values in nickel, cobalt, and platinum.

*Nevada.*—No production or shipment of molybdenum was recorded for Nevada in 1938, but development work on several deposits was reported.

*New Mexico.*—The Molybdenum Corporation of America continued to operate its mine and mill some 7 miles east of Questa along the Red River. The ore is relatively high grade and the tonnage treated comparatively low. Development work on lower levels is reported to be giving encouraging results. The geology and ore deposit have been described by Vanderwilt.[4]

Molybdenite concentrates also were produced by the Nevada Consolidated Copper Corporation at the Chino property in the treatment of copper ores.

*Utah.*—All production in 1938 came from the Utah Copper Co., where molybdenite is recovered as a byproduct in the concentration of copper ores and re-treatment of molybdenum-bearing concentrates. As the molybdenum content of the ore is very low the molybdenite

[2] Peterson, N. P., Geology and Ore Deposits of the Mammoth Mining Camp Area, Pinal County, Ariz.: University of Arizona, Arizona Bureau of Mines Bull., vol. 9, No. 2, April 1, 1938, pp. 1–63.

[3] Richardson, J. K., A Modern Hospital Serves Climax Camp: Eng. and Min. Jour., vol. 139, No. 11, November 1938, pp. 36–38.

[4] Vanderwilt, J. W., Geology of the "Questa" Molybdenite Deposit, Taos County, N. Mex.: Proc. Colorado Sci. Soc., vol. 13, No. 11, 1938, pp. 599–643.

Digitized by Google

concentrates produced are entirely byproduct and fluctuate with the output of copper, thus output was lower in 1938 than in 1937. A material improvement in recoveries, however, explained in large degree the smaller proportionate decline in the production of molybdenite compared with copper.

*Washington.*—The Deertrail Monitor Mines Co. mined about 3,000 short tons of ore at its Monitor mine on Adams Mountain 6 miles east of Fruitland, Stevens County. About 300 tons were milled in the 50-ton flotation mill, from which 3 tons of concentrates were recovered; 5 tons were shipped. Three other concerns—the Copper Mining Co., the Consolidated Mines & Smelting Co., Ltd., and the American Rand Corporation—produced ore in connection with development operations, but the ore was not concentrated, and there were no shipments.

## IMPORTS AND EXPORTS

Exports of molybdenum, principally in the form of concentrates, provide an important outlet for the domestic molybdenum industry. Data are not available, since molybdenum is not classified separately in export statistics; but it appears that 50 to 75 percent of the domestic production is exported. Imports of molybdenum or molybdenum compounds are small.

*Molybdenum ore and concentrates, ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum imported for consumption in the United States, 1934–38*

| Year | Molybdenum content (pounds) | Value | Year | Molybdenum content (pounds) | Value |
|---|---|---|---|---|---|
| 1934 | 213,928 | $124,156 | 1937 | 7,707 | $13,491 |
| 1935 | 68,758 | 40,721 | 1938 | 25 | 81 |
| 1936 | 49 | 213 | | | |

In addition to the quantity shown in the above table 139,535 pounds of ore and concentrates containing 91,905 pounds of molybdenum valued at $41,586 were imported for smelting, refining, and export in 1938 compared with none in 1937. Of the 1938 figure 136,200 pounds containing 90,442 pounds of Mo valued at $40,780 came from Turkey.

## USES

Molybdenum is used principally in the iron and steel industry for making special alloy steels. Continued research is broadening the field of application both in new outlets and as a substitute for and an addition to other alloying elements. Molybdenum may be used alone to impart certain desired properties to iron and steel, but more frequently it is used with one or more of the other ferro-alloying elements.

For most purposes molybdenite ($MoS_2$), the principal mineral raw material, is converted, before using, to ferromolybdenum (a product carrying 60 to 65 percent molybdenum) or to calcium molybdate (a compound resulting from the roasting of molybdenite with lime and containing 35 to 45 percent molybdenum). The latter is the cheaper method of preparing molybdenum for industrial applications. Molyb-

Digitized by Google

denum oxide in briquets is also used in making molybdenum additions to iron and steel.

Improved processes of heat-treating and fabricating high-speed tool steels, in which part of the tungsten has been replaced by molybdenum, have increased the use of molybdenum in this field. Molybdenum is also being employed more generally in stainless steels of the 18–8 type.

Molybdenum compounds find limited use in nonmetallics, but consumption is not large.

## WORLD PRODUCTION

World production of molybdenum comes from only a few mines. Operations in Mexico, Norway, and the United States furnish the bulk of the world requirements. The search for new sources continued during 1938; but, so far as is known, there were no significant developments.

*World production of molybdenum ores and concentrates, 1934–38, in metric tons*

[Compiled by M. T. Latus]

| Country | 1934 | 1935 | 1936 | 1937 | 1938 |

| Yugoslavia | | 18 | | 84 | 19 |

[1] Less than 1 ton.
[2] Data not available.
[3] Exports.

*Canada.*—In 1938 the Zenith Molybdenite Corporation, formerly the Phoenix Molybdenite Corporation, Ltd., Renfrew County, Ontario, reported shipment to England and France of 7 metric tons of concentrates valued at $4,500; these had been produced in 1937. Prospectors have been active recently both in prospecting and developing molybdenite properties in Ontario.

*Mexico.*—Output, which was lower in 1938 than in 1937, comes principally from the Greene Cananea Copper Co., where molybdenite concentrates are recovered as a byproduct in the treatment of copper ores. Mine and reduction works at Cananea were closed by a strike during the latter half of September; then a 2-year labor contract was signed.

*Morocco, French.*—French Morocco is the largest producer in Africa. Much of the output comes from the mine of the Société le Molybdène near Azegour. A discovery of deposits in the Haut-Tifnout region near the Souss valley recently has been reported.[5]

[5] Metal Bulletin (London), The Tifnout Deposits: No. 2369, February 24, 1939, p. 16.

Digitized by Google

*Norway.*—The Knaben Mölybdan Gruber was the only producer in Norway in 1938. Output was larger than in 1937. A concentrating plant was being installed at the Laxadalen Molybdängruber at Gildeskal, northern Norway, but no output has yet been recorded.

*Turkey.*—Production of molybdenum in Turkey is small, but shipments were made to the United States in 1938.

## TUNGSTEN

Interest in the tungsten industry in 1938 continued to be centered chiefly on conditions in China, the principal source, but the effect of hostilities was not as pronounced as in 1937. Japanese gains in 1938 did not give them control of the tungsten-producing areas; but the railroad through South China to Canton and Hongkong, the main route of flow after the capture of Shanghai in 1937, fell to the invaders late in 1938. Tungsten concentrates in reduced quantities continued to move out, however, principally through Swatow, and this movement together with supplies available from other sources and lessened demand eased the tungsten situation in 1938.

Apparently the United States was the second largest producer in 1938, and domestic output was the highest of any before and since the war years 1916–18, when exorbitant prices and shortage of supplies stimulated a country-wide search for strategic minerals. Although production from domestic mines increased over 1937, shipments declined, resulting in some stock at mines or mills. The development and reequipment of properties continued in the Western States, and activities around Bishop, Calif., attracted attention during 1938. As the year progressed, however, there was some curtailment in the domestic industry.

*Salient statistics of the tungsten industry in the United States, 1937–38*

| | 1937 | | 1938 | |
|---|---|---|---|---|
| | Short tons | Value | Short tons | Value |
| Production (60 percent $WO_3$) | 3,500 | (1) | 4,000 | (1) |
| Concentrates shipped (60 percent $WO_3$) | 3,500 | $4,094,000 | 3,044 | $3,161,498 |
| Imported for consumption (W content) | 2,848 | 3,073,612 | 81 | 138,693 |
| Stocks in bonded warehouses, Dec. 31: | | | | |
| Ore (W content) | 401 | 707,350 | 326 | 602,376 |
| Metal (W content) | 4 | 9,447 | 10 | 24,182 |

[1] Figures not available.

*Strategic reserve.*—Tungsten is listed as a strategic commodity, but the position of the United States with regard to this essential metal is far less vulnerable than that with respect to manganese, tin, or chromium. Under the tariff the industry has continued, and this protection together with the high world prices maintained in recent years have resulted in a large measure of self-sufficiency. No purchases for strategic stock-pile purposes have been made by the Navy Department in connection with its limited program during the last 2 years. The tungsten situation, however, is being studied thoroughly in connection with probable purchases should appropriations in legislation now pending become available. The following tables present the historical background for consideration of the strategic nature of tungsten.

Digitized by Google

[1] Alaska, Connecticut, Missouri, Montana, New Mexico, Oregon, and Utah, and States indicated by "3".
[2] Less than 1 ton.
[3] Bureau of Mines not at liberty to publish figures.

The following information regarding domestic sources is quoted from a Report upon Certain Deficient Strategic Minerals by the staffs of the Geological Survey and the Bureau of Mines.

*Sources.*—Most tungsten deposits are tabular bodies that either persist downward to great depths in the earth (veins) or are localized and nearly horizontal (replaced beds). Two minerals, scheelite (containing 63.9 percent tungsten) and wolframite (containing 60.7 percent tungsten) are the source of almost all tungsten. Only a few ores treated to recover tungsten yield other metals, so that tungsten is rarely a byproduct.

Digitized by Google

Tungsten minerals are rather widespread in the United States, but most of the attempts at commercial production are confined to 11 Western States, and 3 (Nevada, California, and Colorado) currently yield more than 90 percent of the production. As the prices offered for tungsten ores have fluctuated more widely than those for the other strategic metals, the yield from the several districts, as well as the total for the United States, has also fluctuated widely. There can be hardly any doubt that some deposits have become exhausted at depths that range from 500 to 1,000 feet, and that elsewhere, even though the tungsten mineral persists, costs of production have increased.

Since 1900 the United States has imported some tungsten in the form of ore or alloys each year, and even though production has nearly equaled or even exceeded apparent consumption during a few years, dependence on foreign sources has tended to increase. A tariff was first imposed in 1909, and the latest act of 1930 provides for 50 cents per pound on the tungsten in ore and concentrate and as much as 60 cents per pound plus 50 percent ad valorem on metallic tungsten. This is higher than at any previous time. Most of the imported tungsten is in the form of ore or concentrate, and 80 percent or more is derived from China, which is the principal world source. During the past 5 years (1933–37) domestic production has been about half of the apparent consumption.

*Production from domestic mines.*—Since 1926, production of tungsten in Nevada has exceeded that of any other State, and one mine, discovered in 1917, is now the principal source in the United States. This mine derives its ore from an altered bed of limestone which contains about 1¼ percent of disseminated scheelite. This type deposit is now known to exist widely in western Nevada and southeastern California, and it is probable that other important deposits of similar nature will be found. Although mine operations rarely explore such deposits far in advance of mining and definite figures can rarely be assigned to reserves, the number and widespread distribution of the deposits seem to assure current production for a decade or more.

Numerous tungsten deposits have been explored in California, but one mine (Atolia), near Randsburg, now mining 1,400 feet below the surface, has yielded from 60 to 95 percent of the tungsten output of the State since 1909. Nearby placers have yielded considerable concentrate also. Promising, but low-grade, deposits have been extensively explored near Bishop and elsewhere.

Tungsten-bearing veins have been explored in several parts of Colorado, but a few mines in a single district (Nederland, Boulder County) have yielded nearly all of the output from the State. One mine has attained a depth of approximately 900 feet, but most of the product has been mined within 500 feet of the surface, because veins are narrow and costs increase rapidly with depth.

Even though many tungsten deposits have been explored in the eight other western States, as well as in Missouri and Connecticut, existing records indicate that shipments can be made only during times of high prices.

## PRICES

The quotations on tungsten ore or concentrates continued the decline that began in the last quarter of 1937. The low point was reached in May, after which there was some recovery, but the market was weak for the rest of 1938. The fear of stoppage of concentrates from China due to Japanese control over the routes of transportation was a bullish factor, but apparently this was counteracted by availability of supplies from other sources and by reduced demand. London prices for Chinese wolframite concentrates containing 65 percent $WO_3$, as given by the Mining Journal (London), were highest at the beginning of the year, when the quotation was 78s.–80s. The quotations declined steadily until May, when the average for the month was 37s. 1d. Subsequently the quotation rose until the last quarter, when there were minor fluctuations. The average quotation for December was 54s. 5½d. According to the Engineering and Mining Journal domestic scheelite quotations, f. o. b. New York, for concentrates containing 65 to 70 percent $WO_3$, followed somewhat the same pattern, opening the year at $22–$25 per short-ton unit

Digitized by Google

declining to $16–$20 in May, with the closing quotation at $20. The quantity of concentrates shipped from China on barter arrangements was not without effect on the tungsten quotations.

## DOMESTIC PRODUCTION

Higher prices in 1937 and early 1938 stimulated activities in the domestic tungsten industry, particularly in California, but lower prices later in the year curtailed operations, and a number of properties closed. Although production of concentrates increased shipments declined, resulting in accumulation of some stocks at the mills. Output—the highest recorded in peacetime—came from a rather large number of widely scattered locations, and shipments were made from nine States (Arizona, California, Colorado, Idaho, Missouri, Nevada, New Mexico, Utah, and Washington). Developments in the domestic tungsten-producing industry in recent years are tending to make the United States more nearly self-sufficient in this strategic mineral commodity at prices that have maintained. This situation, however, depends on tariff, which at present amounts to $7.931 per short-ton unit of $WO_3$ on ore and concentrates.

*Concentrated tungsten ores (reduced to equivalent of 60 percent $WO_3$) produced in the United States, sold in 1934–38, and average price per unit*

| Year | Short tons | Value | Average price per unit | Year | Short tons | Value | Average price per unit |
|---|---|---|---|---|---|---|---|
| 1934 | 2,049 | $1,791,316 | $14.57 | 1937 | 3,500 | $4,094,000 | $19.50 |
| 1935 | 2,395 | 1,921,017 | 13.37 | 1938 | 3,044 | 3,161,498 | 17.31 |
| 1936 | 2,612 | 2,323,818 | 14.83 | | | | |

Gravity concentration generally is used in beneficiating tungsten ores. In crushing ore for concentration there is considerable pulverization of friable scheelite, which results in abnormal losses in the slimes. The use of flotation for the recovery of scheelite from slimed material has been investigated by the Bureau of Mines.[6] Ultraviolet lamps for detecting scheelite by fluorescence have aided the prospector, miner, and millman engaged in the search for and reduction of tungsten ores carrying it. The use of this equipment has been described by Heizer.[7]

*Arizona.*—Shipments of tungsten concentrates from Arizona operations totaled only 35 short tons containing 63.09 percent $WO_3$ in 1938 compared with 312 tons averaging 67.15 percent $WO_3$ in 1937. Output comprised scheelite, wolframite, huebnerite, and ferberite concentrates and came from scattering small operations in Cochise, Gila, Mohave, Pima, and Yavapai Counties. The mill at the Boriana mine near Yucca, Mohave County, destroyed by fire in November 1937, was rebuilt but not operated in 1938.

*California.*—Shipments of tungsten concentrates (all scheelite) from California amounted to 770 short tons containing 65.44 percent $WO_3$ in 1938 compared with 511 tons containing 67.68 percent $WO_3$

[6] Leaver, E. S. and Royer, M. B., Flotation for Recovery of Scheelite from Slimed Material: Bureau of Mines Tech. Paper 585, 1938, pp. 1–24.

Digitized by Google

in 1937. The largest producer, the Atolia Mining Co. near Atolia in San Bernardino County, shipped 339 tons containing 59.71 percent $WO_3$. The company milled 13,289 tons of ore containing 1.82 percent $WO_3$. Sixteen other producers—8 in San Bernardino County, 5 in Inyo, and 1 each in Kern, Mono, and Tulare Counties—contributed to the California total. The increased number of producers—17 in 1938 compared with 8 in 1937—attest to the increased interest in tungsten in California, but as prices dropped later in 1938 a number of operations were closed. Activities in recent years in the region around Bishop have resulted in some significant developments that may serve further to increase domestic output.

*Colorado.*—Output of tungsten in Colorado was higher in 1938 than in 1937. Total shipments were 360 short tons of concentrates averaging 40.05 percent $WO_3$. Most of the output was ferberite from Boulder County, but there were small shipments of huebnerite from gold-mining operations in San Juan County. The principal shipments came from the mill of the Gold, Silver & Tungsten, Inc., at Tungsten, Boulder County. The other large producer (the mine of the Wolf Tongue Mining Co. near Nederland) was idle for 9 months but is planning extensive underground development work in 1939. The mill treated 871 short tons of ore containing 2.8 percent $WO_3$. A 50-ton concentration mill was built at the Conger mine in 1938 by the Vanadium Corporation of America.

*Idaho.*—The Ima mine on Patterson Creek about 11 miles east of May operated during the last 10 months of 1938. The mill was enlarged to 150 tons capacity; 26,823 short tons of ore containing 0.5 percent $WO_3$ were milled, yielding 139 short tons of huebnerite concentrates averaging 66.54 percent $WO_3$. The mill also makes a sulfide concentrate carrying silver, copper, lead, and zinc.

*Missouri.*—A small shipment (less than 1 ton) of high-grade concentrates was reported from Missouri in 1938. The hand-picked ore came from the dump of the old Silver mine 10 miles west of Fredericktown, Madison County.

*Nevada.*—Nevada retained its position as the principal tungsten producer in 1938; shipments of concentrates totaled 1,461 short tons reduced to equivalent 60 percent $WO_3$. A large part of the output was scheelite concentrates from mines of the Nevada-Massachusetts Co. near Mill City and Mina. The company has sunk the Humboldt and Stank shafts to the 1,350 level and is reopening and developing the Sutton ore body. The new mill operating on tailings is working successfully, and a good grade of concentrate (70 percent $WO_3$) is being produced. The Tungsten Metals Corporation at Ely, White Pine County, produced from three mines and was the largest of several other small operators that contributed to the Nevada total in 1938.

Development work continued, and new equipment was installed at the Oreana mine in Pershing County by the Rare Metals Corporation. The Oreana tungsten deposit is unique among American tungsten deposits in that the scheelite mineralization is considered pegmatitic.[8] An addition to the mill at the Nightingale mine 50 miles west of Lovelock, Pershing County, was installed in 1938.

Digitized by Google

*New Mexico.*—A small shipment of huebnerite concentrates averaging 53.12 percent $WO_3$ was made from Luna County in 1938.

*Utah.*—Shipments from Utah in 1938 totaled only 16 short tons (all scheelite) averaging 25.50 percent $WO_3$. The bulk of the shipments came from the Star Dust mines near Gold Hill operated by Star Dust Mines, Inc. Less than 1 ton of scheelite concentrates running 71.46 percent $WO_3$ was shipped from Juab County.

*Washington.*—Shipments of tungsten concentrates from Washington in 1938 comprised 328 short tons averaging 55.39 percent $WO_3$. Virtually all the shipments (326 tons) came from the Germania mine near Fruitland in Stevens County and were wolframite concentrates containing 55 percent $WO_3$. Operations at the Germania mine were curtailed at the close of 1938. The remaining shipments (2 tons) came from another operator in Stevens County.

## FOREIGN TRADE

Domestic supplies of tungsten are supplemented by imports, principally of concentrates but also in other forms. Imports of ore and concentrates for consumption (tungsten content) dropped sharply in 1938 and totaled only 162,744 pounds compared with 5,561,022 pounds in 1937. Of the 1938 total, 43 percent came from China and 41 percent from British Malaya. In addition, 828,660 pounds of tungsten in concentrates were imported for smelting, refining, and export compared with 502,571 pounds in 1937. There is no record of any exports of tungsten ore or concentrates from this country. Imports of tungsten and tungsten carbide, and of tungstic acid and other compounds of tungsten, were lower in 1938.

[1] Includes combinations containing either metal or carbide.
[2] Austria included with Germany beginning May 6.

## USES

The principal uses of tungsten are in the manufacture of high-speed-tool steels, cemented tungsten carbides, stellites, and electric-light and radio-tube filaments; in the preparation of various chemicals, such as pigments; and in the tanning of white leather. In recent years cemented tungsten carbide has been employed widely in the commercial field. Methods of manufacture, as well as properties and uses, have been described by Sykes.[9] A new alloy of tungsten with 4-percent copper and 6-percent nickel is said to be a suitable material for radium containers. A new process [10] for combining tungsten by electrodeposition with other metals is said to be susceptible to close control.

## WORLD PRODUCTION

World output of tungsten was lower in 1938 than in 1937, when a new peak was established. Although complete figures are not available, preliminary data indicate that world production in 1938 may have reached 32,000 metric tons.

[1] In addition to the countries listed, tungsten ore is produced in the U.S.S.R., but no data of production are available for the period under discussion.
[2] Exports.
[3] Data not available.
[4] Exclusive of Spain.
[5] Less than 1 ton.
[6] Exclusive of Japan.

*Argentina.*—Argentina is the second largest producer of tungsten in South America. Output comes principally from the Provinces of San Luis and Cordoba; much smaller amounts are produced in San Juan

Digitized by Google

and Catamarca. Virtually all the yield is exported, a large part going to Europe.

*Bolivia.*—Bolivia is the largest producer in South America. The largest deposits occur in the Department of Oruro, while smaller deposits are found in Potosi, La Paz, and Cochabamba. Bolivian tungsten concentrates (wolframite and scheelite) are exported, largely to Europe.

*Burma.*—Output in Burma comes principally from the Hermingyi mine near Tavoy and the Mawchi mine in the southern part of Karenni State. The ores from the Mawchi mine are said to be complex in character and not easy to treat for their tin and tungsten contents, but the ores from the Hermingyi are much simpler. The ore reserves at the Mawchi mine are said to contain 3.24 percent tin and tungsten. The proportion of tungsten to tin in the Hermingyi ores is about 2 to 1. Most of the concentrates from India are shipped to the United Kingdom. Exports from Burma in 1938 were 10,598 metric tons.

*China.*—The Sino-Japanese hostilities continued their adverse effect on the flow of tungsten ore from China, the largest world source. The principal production comes from Hunan, Kiangsi, and Kwangtung, where the tungsten-producing areas are not under Japanese control, and the mines still are being worked extensively. Formerly much of the exports moved out of Shanghai, coming from inland through the river ports of Hankow, Hupeh Province; Kiukiang, Kiangsi Province; and Changsha, Hunan Province. With the closing of the Yangtze and Whangpoo Rivers and exhaustion of the stocks on hand in 1937, exports from Shanghai ceased, and Chinese concentrates moved out via the Canton-Hankow Railroad for transshipment at Hongkong. In 1938 Canton fell to the Japanese, and the Chinese Central Government endeavored to route all tungsten ore shipments via South China ports (Swatow, Haiphong, and Macao) not under Japanese control, or through Indochina. Exports in 1938 were 13,387 metric tons (60 percent $WO_3$ basis) compared with 17,895 tons in 1937. There were no exports during the last 2 months of 1938. A large proportion of the exports in 1938, which went principally to Europe, was shipped under barter agreements.

It was reported early in 1939 that the Chinese Government has granted to the Peiping Syndicate, Ltd., exclusive selling rights for Chinese tungsten ore, including the stocks in Honkong.

*India, British.*—There is little or no production of tungsten in India. Production previously credited to India came from Burma, which was split from India as a separate State as of April 1, 1937.

*Malay States.*—The Kramat Pulai mine near Ipoh is the principal producer in the Malay States. The ore is scheelite of good quality, but the reserves are limited. Exports in 1938 amounted to 665 metric tons of concentrates, of which 287 metric tons were scheelite concentrates and the remainder wolframite concentrates. The exportation of tungsten ore containing more than 1.5 percent tin has been prohibited by the High Commissioner of the Federated Malay States, except under written authorization by the Chief Inspector of Mines.

*Portugal.*—Output in Portugal, the largest European producer, in 1938 increased 36 percent over 1937 and nearly doubled the 1936 figure. The Beralt Tin & Wolfram, Ltd., with properties at Panasqueira in the Province of Beira Baixa, district of Castello Branco,

Digitized by Google

was the largest producer. The ore is low-grade, and it has been stated that 300 tons of rock must be broken to produce 1 ton of concentrates. Exports (2,450 metric tons in 1938) went to European manufacturers of ferrotungsten.

*Southern Rhodesia.*—The African Continent produces little tungsten; the principal output comes from Southern Rhodesia, where production increased to 329 metric tons in 1938 from 275 tons in 1937.

## VANADIUM

Vanadium output in 1938 maintained the high level reached in 1937, although there was a noticeable shift in sources. The world supply comes from a limited number of operations, principally in four countries, of which Peru normally is the most important. Production in that country, all from the Minasragra mine, dropped abruptly in 1938. A striking feature of the year was the large increase in domestic production (shipments from mines), and in 1938 the United States became the largest producer. Greatly increased output in the Paradox Valley region in Colorado swelled the domestic total. Production in Northern Rhodesia was 59 percent above 1937, while output in the Territory of South-West Africa dropped a little. World sources of vanadium may be supplemented further in future by the recovery of vanadium from the treatment of pig iron made from vanadium-bearing iron ores at ferrous smelters in Germany. A plant for the recovery of vanadium was completed in 1938 in Japan by the Japan Iron Sand Industrial Co.

Despite the large increase in domestic production imports for consumption into this country increased. Purely nominal quotations for vanadium ore were unchanged throughout 1938 at 27½ cents per pound of contained $V_2O_5$.

*Salient statistics of the vanadium industry in the United States, 1937–38*

| | 1937 | | 1938 | |
|---|---|---|---|---|
| | Quantity | Value | Quantity | Value |
| Production: | | | | |

### DOMESTIC PRODUCTION

Production in the United States of vanadium contained in all types of ores from which it was recovered totaled 1,613,155 pounds in 1938 compared with 1,086,125 pounds in 1937. Output came from Arizona, Colorado, Nevada, and Utah, Colorado supplying the largest quantity.

*Arizona.*—Vanadium was produced from the operations of the Molybdenum Gold Mining Co. and the Mammoth-St. Anthony, Ltd.,

Digitized by Google

near Mammoth, where complex ores containing recoverable values in gold, silver, lead, molybdenum, and vanadium are treated in a flotation mill operated by the latter company. The mill treated 165,465 short tons of ore, from which 4,191 tons of concentrates containing 238,000 pounds of $V_2O_5$ were recovered. The geology and ore deposits of the Mammoth mining camp area have been described by Peterson.[11] Development work was continued by the International Vanadium Corporation at the Dripping Springs mine near Globe, but there was no production.

*Colorado.*—The production of vanadium in Colorado in 1938 amounted to 1,382,736 pounds in vanadium and carnotite ores. The largest output was from operations of the United States Vanadium Corporation in Paradox Valley. The ore runs under 2 percent $V_2O_5$; and the vanadium is recovered as $V_2O_5$ by roasting the ore with salt, leaching the sodium vanadate with water, and precipitating the $V_2O_5$ with acid. The precipitate is then sintered to a product containing about 88 percent $V_2O_5$.

A 20-ton mill was erected near Gateway, Mesa County, by the Gateway Alloys, Inc., to treat ores mined from nearby claims.

*Nevada.*—Output in 1938—only 7 tons of vanadinite and descloizite concentrates—came from operations at the Spelter mine near Goodsprings, Clark County.

*Utah.*—Vanadium-bearing ores were produced at a number of rather widely scattered locations in Utah. Shipments totaling 172,194 pounds of contained $V_2O_5$ originated in Grand and San Juan Counties in the southeastern part of the State. The largest output was made by the Harbro mines near Cisco, Grand County, and consisted of concentrates containing carnotite.

## FOREIGN TRADE

Imports of vanadium ores in 1938, all from Peru, amounted to 9,981 short tons containing 1,384,320 pounds of vanadium. Data on exports are not given by the Bureau of Foreign and Domestic Commerce, but in 1938 several hundred short tons of vanadium-bearing ore or concentrates were exported to Japan.

## USES

The principal use of vanadium is in the manufacture of special alloy steels and irons. Minor quantities are employed as a catalyst in the manufacture of sulfuric acid in the form of ammonia metavanadate, and in the nonferrous, glass, ceramic, and color industries. Vanadium produces high-strength steel and iron with much less exacting heat treatment than is necessary with other alloys, at a lower cost for both heat treating and machinery.[12]

## WORLD PRODUCTION

Despite the sharply reduced yield in Peru, one of the principal sources, world output in 1938 exceeded that in 1937, owing principally to the large increase in production in the United States. Output in

Peru comes from the Minasragra mine of the Vanadium Corporation of America. Exports from Peru comprised 7,453 metric tons of ore and 2,886 tons of concentrates, all of which moved to the United States. Three mines—the Abenab and Baltika of the Southwest Africa Co., Ltd., and the Nageib mine of the Otavi Minen and Eisenbahn Gesellschaft—contributed to the total in the Territory of South-West Africa. All the ore, which runs about 19.75 percent $V_2O_5$, is exported to England and Europe. Production in Northern Rhodesia was fused vanadic oxide from operations of the Rhodesian Broken Hill Development Co., Ltd., which also produces zinc.

# BAUXITE AND ALUMINUM

By HERBERT A. FRANKE AND M. E. TROUGHT [1]

## SUMMARY OUTLINE

| | Page | | Page |
|---|---|---|---|
| Summary | 633 | Aluminum | 640 |
| Salient statistics | 633 | Production | 640 |
| Bauxite | 634 | Consumption | 643 |
| Production | 634 | Prices | 643 |
| Consumption by industries | 637 | Foreign trade | 644 |
| Aluminum | 637 | Technologic developments | 645 |
| Abrasive | 637 | World bauxite and aluminum industries | 646 |
| Chemical | 637 | Bauxite production | 646 |
| Oil refining and refractory | 639 | Aluminum production | 647 |
| Prices | 639 | Aluminum consumption | 648 |
| Foreign trade | 639 | Review by countries | 648 |

As a result of the recession in industrial activity, production and consumption of aluminum in the United States in 1938 fell below the records established in 1937. Primary aluminum production declined 2 percent and consumption 47 percent. Quoted prices of aluminum remained unchanged throughout the year. The United States Department of Justice continued its suit against the Aluminum Co. of America, charging violation of the antitrust laws. Under the Canadian Trade Agreement the United States import duty on aluminum was reduced from 4 to 3 cents per pound. At the close of the year the outlook was improved by the upturn in business during the last quarter.

The domestic bauxite industry likewise experienced a downward trend in 1938, as indicated by decreases in production, consumption, and foreign trade. Although total bauxite consumption was only 6 percent lower, domestic production fell 26 percent, largely as a result of the increased use of foreign ore. Imports and exports of bauxite declined 10 and 53 percent, respectively, but net imports advanced 23 percent. The proportion of domestic needs supplied by domestic mines thus dropped from 60 percent in 1937 to 47 percent in 1938. Quoted prices for bauxite in 1938 differed little from those in 1937.

Digitized by Google

Although official data on world output of bauxite and aluminum in 1938 are incomplete, both commodities probably established new high records. For the third time in the last 5 years the production of aluminum in Germany exceeded that in the United States. Of the total output of the world, Germany contributed 29 percent and the United States 23 percent. Canada, U. S. S. R., and France ranked next in importance as producers. The total consumption of more than 500,000 short tons of aluminum in 1938 can be attributed partly to the strategic importance of the metal in a war-threatened world. Totalitarian countries have found aluminum an expedient substitute for many deficient metals. In addition technologic research has developed many new industrial uses.

Although world output of aluminum in 1938 increased about 17 percent over 1937, bauxite production advanced only 5 percent. France, the leading bauxite-producing country, maintained the high output level of 1937, and British Guiana, Hungary, the U. S. S. R., and Yugoslavia achieved a substantial increase in production. The United States ranked seventh in importance and produced only 8 percent of the total.

## BAUXITE

### PRODUCTION

Domestic production of bauxite in 1938 was 26 percent less in quantity and value compared with 1937. The entire decline can be attributed to decreased production at mines in Arkansas and Georgia as shipments from Alabama increased. The underground and open-pit mines in Saline and Pulaski Counties, Ark., produced 95 percent of the total domestic output. The remaining 5 percent was contributed by mines in Barbour and Henry Counties, Ala., and in Sumter County, Ga.

Heretofore reported shipments of bauxite have included crude, dried, and calcined ore but have not considered the difference in the moisture content of the various products which may vary widely according to locality and the amount of processing involved. These statistics did not provide a suitable basis for comparing output by years, localities, or consuming industries. To place all tonnages on a comparable basis, shipments now have been converted to a theoretical dried bauxite equivalent, which not only presents a more accurate picture of the details of the domestic industry but also affords a more equitable comparison of the domestic output with imports and foreign production.

The actual shipments shown in the table represent the condition in which the ore was shipped by the mining companies to consumers. Some consumers maintain processing plants near the mines and in consequence ship the products to their final consuming plants in more concentrated form than they are purchased from the mines. Very little crude ore is shipped any great distance. Net shipments from mining areas in 1938, including material moving both from producers' plants and consumers' processing plants, comprised 207,132 tons of dried bauxite, 50,939 tons of calcined, and only 9,408 tons of crude. Shipments of activated bauxite, although only partly calcined, are included with those of calcined ore.

Digitized by Google

The following table shows both the condition of bauxite as shipped and the estimated dried bauxite equivalent of these shipments, by States.

*Bauxite shipped by producers in the United States, 1934–38, by States*

| State and year | Long tons | | | | | Value, f. o. b. mine |
|---|---|---|---|---|---|---|
| | Crude | Dried | Calcined | Total | | |
| | | | | As shipped | Dried bauxite equivalent | |

AMERICAN CYANAMID & CHEMICAL CORPORATION, 30 Rockefeller Plaza, New York, N. Y.—Ozark underground mine, Saline County, and Rauch underground mine, Pulaski County, Ark.; Hatton underground mine, Sumter County, Ga.

ARKANSAS BAUXITE CORPORATION, Bauxite, Ark. (mining by West Bauxite Mining Co.).—Standard and McDonald underground mines and Bizzell open-pit mine, Saline County, Ark.

CONSOLIDATED CHEMICAL INDUSTRIES, INC., 811 Petroleum Building, Houston, Tex.—Alexander underground mine, Saline County, Ark.

CROUCH MINING CO., INC. (General Abrasive Co.), P. O. Box 35, Bridge Station, Niagara Falls, N. Y.—England underground mine, Pulaski County, Ark.

DIXIE BAUXITE CO., INC., Sweet Home, Ark.—Dixie No. 2 underground mine, Pulaski County, Ark.

BENJAMIN EASTERLIN, Americus, Ga.—Easterlin open-pit mine, Sumter County, Ga.

FLORIDIN CO., 220 Liberty Street, Warren, Pa.—Scott open-pit mine, Henry County, Ala.

PULASKI BAUXITE CO., 301 Southern Building, Little Rock, Ark.—Pulaski open-pit mine, Pulaski County, Ark.

REPUBLIC MINING & MANUFACTURING CO., 230 Park Avenue, New York, N. Y.—Lantz, Bertha, Maud Nos. 2 and 3, Sections 14, 23, and 26 open-pit mines, Saline County, Ark.; Ratcliffe open-pit and underground mine, Pulaski County, Ark.; Neilson, Davis, and Crosscut No. 23 underground mines, Saline County, Ark.; Eufaula open-pit mines (chiefly Baker and Clarke), Barbour and Henry Counties, Ala.

Most of these producers operate beneficiating and drying or calcining plants near their mines. Other companies that purchase bauxite but operate processing plants in the mining area are: Aluminum Ore Co., East St. Louis, Ill.—at Sweet Home, Ark.; Max B. Miller & Co., Inc., 501 Fifth Avenue, New York, N. Y.—at West Bauxite, Ark.; Norton Co., Worcester, Mass.—at Bauxite, Ark.; and Porocel Corpo-

Digitized by Google

ration, 260 South Broad Street, Philadelphia, Pa.—plant under construction at Berger, Ark.

There were only two new bauxite-producing concerns in 1938—the Consolidated Chemical Industries, Inc., and the Floridin Co. The latter has acquired bauxite deposits in Henry and Barbour Counties, Ala., as well as the drying plant of Charles Lennig & Co. at Eufaula, Ala. The crude bauxite produced by the company in Henry County in 1938 was shipped to Quincy, Fla., to be activated. The Crouch Mining Co., Inc., plans to complete sinking a shaft on its Young bauxite property, Saline County, in 1939. Both Charles Lennig & Co. and J. M. Mathison, producers of bauxite in southeastern Alabama in 1937, reported no shipments in 1938. Of significance recently in the industry was the installation of magnetic separation, screening, and other processing equipment in the Arkansas mining area (see Minerals Yearbook 1938, p. 579), chiefly to serve demands of the chemical and oil-refining industries. Max B. Miller & Co., Inc., produced activated bauxite at its new plant near that of the Arkansas Bauxite Corporation, and the Porocel Corporation began erection of a processing plant near that of the American Cyanamid & Chemical Corporation, which controls the new concern jointly with the Attapulgus Clay Co.

Aluminum is classed as one of the strategic materials by the Army and Navy Munitions Board, chiefly because of the limited quantities of commercial-grade bauxite available in the United States. Owing to recent interest in national defense it seems appropriate at this time to present a table containing data on bauxite production and consumption since 1910.

*Production, imports, exports, and apparent consumption of bauxite in the United States, 1910–38, in long tons*

| Year | Domestic production | | | | | Imports | Exports | Apparent consumption |

## CONSUMPTION BY INDUSTRIES

Virtually all the bauxite produced in and imported into the United States is consumed by the aluminum, chemical, abrasive, oil-refining, and refractory industries. A list of the principal domestic bauxite consumers appears on pages 669 and 670 of Minerals Yearbook 1937.

The following table shows producers' shipments of bauxite to consumers in the condition shipped—that is, crude, dried, activated, and calcined ore—and the dried bauxite equivalent of these products. Unless otherwise noted all mention of domestic production and consumption in the discussion that follows is in terms of dried bauxite.

*Bauxite shipped by producers in the United States, 1934–38, by consuming industries, in long tons*

[1] Crude, dried, activated, and calcined.
[2] Small quantity of bauxite shipped to makers of refractories probably included under "abrasive."

The supply of bauxite (dried-bauxite basis)—that is, domestic production plus net imports—totaled 689,170 tons in 1938 compared with 735,766 tons in 1937. Net imports accounted for 53 percent of the total in 1938 compared with 40 percent in 1937.

*Aluminum.*—All domestic ore used in aluminum manufacture comes from Arkansas. Shipments in 1938 represented 45 percent of the total bauxite output of the United States. Consumption was 30 percent less than in 1937, owing principally to the increased proportion of imported ore used. More than two-thirds of the industry's bauxite requirements came from South America, chiefly Surinam. All bauxite used by the industry was refined at East St. Louis, Ill., and at the new Bayer-process plant, Mobile, Ala.

*Abrasive.*—The abrasive industry consumed 28 percent less bauxite in 1938 than in 1937. It remained the second largest consumer of domestic ore and took 33 percent of the total bauxite shipped by producers. Calcined bauxite containing 78 to 84 percent $Al_2O_3$ and refined alumina are used in the manufacture of artificial corundum, emery, and other abrasives.

*Chemical.*—Domestic shipments of bauxite to the chemical industry decreased 15 percent in 1938 and represented 20 percent of the total ore shipments. Of the total bauxite consumed by this industry domestic ore comprised 52 percent and imported ore, chiefly from British Guiana, 48 percent. Producers of aluminum salts reported the use of bauxite equivalent to 173,000 long tons of dried bauxite in 1938, only 1 percent less than in 1937. These manufacturers also used 4,068 short tons of alumina, 610 tons of aluminum metal, and a

Digitized by Google

small quantity of clay and alunite. Domestic shipments of aluminum salts in 1938 dropped 12 percent.

New plants producing aluminum sulfate in 1938 were those of the Natural Products Refining Co., at Jersey City, N. J., and the Kimberly-Clark Corporation, at Niagara, Wis. The American Cyanamid & Chemical Corporation started construction of new aluminum sulfate plants at Mobile, Ala., and Georgetown, S. C.

*Oil refining, refractory, and other.*—Although activated bauxite began partly to replace natural fuller's earth in decolorizing lubricating oils by percolation methods only in 1937, it already is used widely in Pennsylvania and the Mid-Continent field. Owing largely to the property of indefinite revivification, activated bauxite granules costing $30 to $40 a short ton f. o. b. Arkansas can compete with the lower-cost, shorter-lived fuller's earth ($22 a ton).

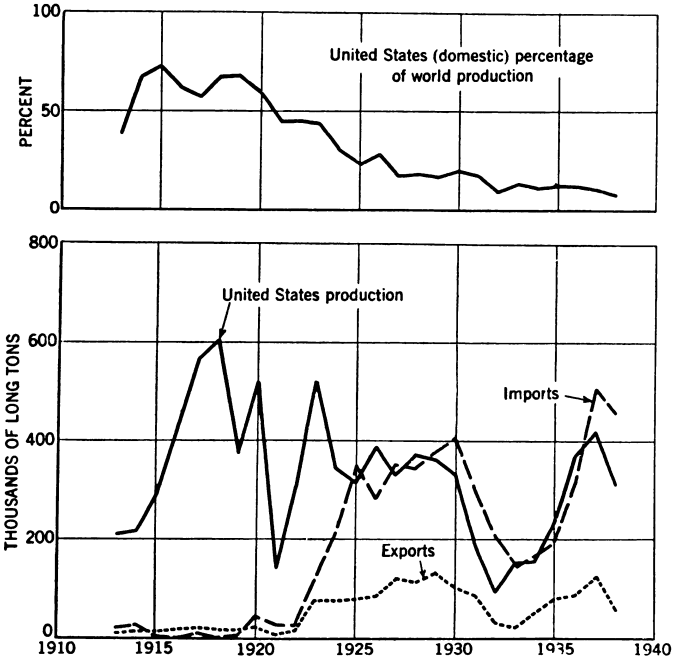

FIGURE 1.—Trends in production, imports, and exports of bauxite, 1913–38.

The refractory industry consumed only about 1 percent of the domestic output of bauxite in 1938, and all the domestic calcium aluminate cement was made from imported bauxite obtained largely from Greece.

## PRICES

In 1938 producers of bauxite in the United States reported selling prices ranging from about $2 per long ton for crude, f. o. b. mines, to $40 for activated ore. The weighted average selling price for crushed dried bauxite, f. o. b. mines, was $5.25 per ton and for calcined bauxite, f. o. b. Arkansas mines, $12.38 per ton. The average value for all grades of domestic ores as sold was $5.82 per ton.

## FOREIGN TRADE

Bauxite imports in 1938 declined 10 percent compared with 1937, the largest import year on record, and exports (dry equivalent) 57

Digitized by Google

percent. Of the 1938 imports (chiefly dried ore), Surinam furnished 386,756 long tons, British Guiana 60,044, Greece 8,400, and Netherland India 493. Imports by customs districts were as follows: 279,260 tons to New Orleans, 128,661 to Mobile, 32,929 to Philadelphia, 8,400 to Chicago, and 6,443 to Massachusetts. No bauxite was imported from France in 1938, and apparently the small shipment from Netherland India was for trial purposes only. In addition to bauxite, 64 tons of alumina were imported, almost all from Canada.

*Bauxite imported into and exported from the United States, 1934–38*

| Year | Imports for consumption | | Exports (including bauxite concentrates) | | Year | Imports for consumption | | Exports (including bauxite concentrates) | |
|---|---|---|---|---|---|---|---|---|---|
| | Long tons | Value | Long tons | Value | | Long tons | Value | Long tons | Value |
| 1934 | 166,653 | $1,201,710 | 51,415 | $1,039,955 | 1937 | 507,423 | $3,609,063 | 123,191 | $3,456,916 |
| 1935 | 199,959 | 1,448,592 | 82,491 | 2,191,167 | 1938 | 455,693 | 3,521,325 | 57,726 | 1,459,491 |
| 1936 | 322,790 | 2,370,778 | 84,471 | 2,322,915 | | | | | |

All exports in 1938 classified as bauxite and other aluminum ores, 43,759 long tons (chiefly calcined ore for use in abrasives), went to Canada. Exports of bauxite concentrates and alumina totaled 13,967 tons and were consigned as follows: Norway, 8,966 tons; Canada, 3,926; Sweden, 1,073; China and Denmark, 1 each; and less than a ton each to Brazil and France.

## ALUMINUM

### PRODUCTION

*Primary.*—Domestic production of primary aluminum in 1938 decreased 2 percent in quantity but increased 2 percent in value compared with 1937. The value of aluminum as reported by domestic producers averaged 19.75 cents per pound in 1938 compared with 19 cents in 1937. Of the new aluminum produced in 1938, 40 percent was made at Alcoa, Tenn.; 34 percent at Massena, N. Y.; 14 percent at Badin, N. C.; and 12 percent at Niagara Falls, N. Y.

[1] Based on average price of primary aluminum as reported to Bureau of Mines.

A large part of the expansion program started by the Aluminum Co. of America in 1937 was completed in 1938. On July 26, 1938, the 250-ton-capacity (daily) plant at Mobile, Ala., began producing alumina from South American bauxite by the Bayer process. Ten 5,500-kilowatt, double-tank, grid-control, mercury-arc rectifier units were installed at the Alcoa reduction plant and five at Massena. A

Digitized by Google

new sand foundry and forging plant was completed near Los Angeles, Calif., to serve increasing demands for fabricated aluminum alloys by the aircraft industry on the Pacific coast. Other completed developments included a new extrusion mill at Lafayette, Ind., and expansion of the rolling mill at Edgewater, N. J.

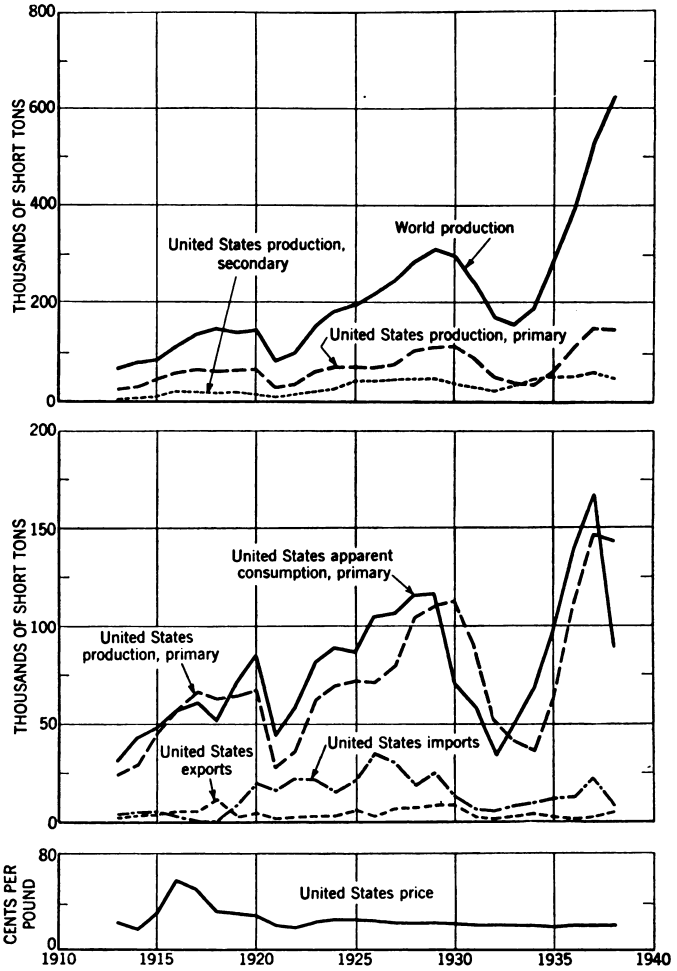

FIGURE 2.—Trends in production, imports and exports, apparent consumption, and average quoted prices of aluminum, 1913–38. Price is for No. 1 virgin 98–99 percent at New York through 1929, thereafter for 99 percent plus virgin ingot, as reported by American Metal Market.

The suit against the Aluminum Co. of America et al., by the United States of America through the Department of Justice, opened on June 30, 1938, in the District Court of the United States for the Southern District of New York. The trial was recessed by Federal Judge Francis G. Caffey on June 30, 1938, until October 13, 1938. By the end of 1938 the Government was still presenting testimony in support of its petition, which asks for dissolution of the company, charging that it is a monopoly in violation of the antitrust laws.

Digitized by Google

*Secondary.*—Output of secondary aluminum declined 38 percent in 1938 compared with 1937, according to J. P. Dunlop, of the Bureau of Mines. The metal recovered unalloyed totaled 16,700 short tons and that in alloys (mainly No. 12), 22,100 tons. Most of the scrap metal collected is consumed as soon as it is remelted. To keep pace with the complexity of aluminum-alloy scrap, secondary refiners maintain laboratories to obtain chemical analyses and to check the specifications of the refined or finished alloys.[2] Production of secondary aluminum was equivalent to 27 percent of the primary output in 1938. Additional details on production of secondary aluminum in 1938 are given in the chapter on Secondary Metals in this volume.

*Historical record.*—Inasmuch as the military and civilian requirements for aluminum have increased greatly, particularly for use in aircraft and heavy transportation, the metal is listed by the Army and Navy Munitions Board as a strategic material. In view of the importance of aluminum for these purposes, a table comprising data on production and consumption since 1910 is presented in this review. Data on the production of aluminum since 1893 are shown in a succeeding table.

*Production, imports, exports, and apparent consumption of primary aluminum and production of secondary aluminum in the United States, 1910–38, in pounds*

[1] Revised figures 1910–31; value unchanged from figures previously published. Revised figures from 1893 to 1909 are given in the following table.

[2] Crude and semicrude, some of which may be secondary aluminum. Imports are not separately recorded prior to July 1911, and imports from July 1911 through 1912 are general imports (adjusted with stocks in warehouses in 1912); 1913–38 are imports for consumption.

[3] Data not available on fluctuations in consumers' stocks, 1910–38, and in producers' stocks, 1910–28. Withdrawals from producers' stocks totaled 7,873,800 pounds in 1933, 52,158,260 in 1934, 55,030,000 in 1935, 26,558,000 in 1936, and 3,483,000 in 1937; additions to producers' stocks totaled 29,074,200 pounds in 1929, 95,303,700 in 1930, 70,683,000 in 1931, 38,948,000 in 1932, and 112,959,000 in 1938.

[4] Data not available.

[5] Not separately recorded prior to July 1917.

## CONSUMPTION

In 1938 the apparent domestic consumption of primary aluminum decreased 47 percent and recovery of secondary aluminum 38 percent compared with 1937. From 1934 to 1938 production of secondary aluminum was equivalent to 45 percent of the apparent consumption of primary metal.

The recession in industrial activity in 1938 caused the lowest consumption of aluminum in any year since 1934, but the marked upturn in business during the closing months of 1938 indicates increased consumption in 1939. The aircraft industry, one of the large users of aluminum, enjoyed a high rate of activity during 1938 and anticipates the greatest year in its history in 1939. Aluminum alloys, because of their strength, durability, and lightness, long have played a large part in the construction of airplane engines and bodies. Manufacturing facilities of American airplane firms were being expanded rapidly late in 1938 to meet the increased demands for aircraft from the United States Government, foreign countries, and commercial air lines. Other types of transportation, such as the automobile, bus,[3] railroad,[4] street-car, and ship [5] industries used large quantities of the metal in 1938 and may consume an even greater tonnage in 1939.

In the mining industry aluminum was used in 1938 for mine skips and cages and for portable tools, such as drills, car loaders, mine cars, hand shovels, power-shovel dippers, and dragline booms.[6] Aluminum is used for chemical equipment because it resists corrosion and has little or no effect on the color of materials processed in it.[7] Aluminum paint is used widely on weather-exposed and interior steel surfaces and on steel products.[8] Since the founding of the industry in 1888 the uses of aluminum have expanded extensively.

## PRICES

The price for 99-percent-plus pure virgin ingot aluminum, delivered, based on open-market quotations in New York, remained unchanged at 20 cents per pound, carload lots, throughout 1938. Quotations

for smaller lots down to 1 ton demanded a ½-cent premium and for less-than-ton lots a 1-cent premium. In London the domestic quotation for aluminum ingot was reduced on July 21, 1938, from £100 per long ton, less 2 percent delivered, to £94, net cash in 30 days, and the export price was cut from £100 to £90 per metric ton. However, on March 23, 1939, the export price was advanced to £95 per metric ton. European prices for aluminum ingot on December 31, 1938, were (converted in American money): 19.5 cents per pound in the United Kingdom, 24.2 cents in Germany, and 16 cents in France.[9] According to Metal Statistics 1939, dealers' 1938 buying prices per pound in New York for principal grades of domestic aluminum scrap averaged 7.58 cents for cast aluminum and 13.18 cents for new aluminum clips. The average selling price of remelted metal, 98½- to 99-percent grade, was 18.40 cents and of No. 12 alloy, No. 2 grade, 14.91 cents.

## FOREIGN TRADE

Imports of crude and semicrude aluminum were 61 percent less in 1938 than in 1937 and exports 134 percent higher. Crude and semicrude metal imports accounted for 10 percent of the apparent consumption of primary aluminum in 1938. Of these imports (8,870 short tons), 2,888 tons came from Norway, 2,647 from France, 1,424 from Switzerland, 1,216 from Canada, and 432 from the United Kingdom. The value of imports of aluminum manufactures decreased 31 percent and that of exports 7 percent. Of the crude and semicrude metal exported in 1938 (6,309 short tons), 2,221 tons went to Germany, 1,118 to the United Kingdom, 1,000 to Switzerland, 927 to Japan, 565 to the U. S. S. R., and 274 to Canada.

## TECHNOLOGIC DEVELOPMENTS

The increasing use of bauxite as an adsorbent for the percolation filtration of paraffin-base oils is based largely upon its property of indefinite revivification without substantial degradation in adsorptive power. The effect of continued revivification upon both the decolorizing value and the "solvent" action of bauxite is discussed by Hubbell and Ferguson.[10] The specifications for bauxite to be used in oil refining comprise high capacity for removing color bodies and other impurities from lubricating oil, high resistance to abrasion, and a high inherent structural strength, including the ability to resist the disintegrating action of steam.

The Bureau of Mines has developed a process for the recovery of alumina, potassium sulfate, and some excess sulfuric acid from alunite [11] derived from the Marysvale (Utah) region.[12] Briefly, the alunite is sintered with boric acid and then leached with water to remove the potash and excess boric oxide, which are separated by brine flotation. The alumina is recovered by sulfuric acid leaching of the water-insoluble residue from the sinter and is precipitated electrolytically from the aluminum sulfate solution. Among the recent United States patents for the production of alumina are Nos. 2,123,650 and 2,127,504, on the treatment of clays, bauxite, etc., and Nos. 2,119,551[13] and 2,134,793, on the treatment of alunite, etc. A loan of $50,000 has been authorized by the Reconstruction Finance Corporation to Aluminum, Inc., Marysvale, Utah, for completion of a plant using the last of these patents.
